ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Good Ataris from oblivion, step up and buy a
minimum of $100.00 of ANY Games/Software in my Classic Atari 8 Bit and/or
Atari ST Catalogs and get 20% off! E-Mail or call Ben at (503)256-9974!

http://BensCatalogs.Atari.org

Ok, so I decided to do the 1200XL CLRPIC "sequel" video upgrade found here:

http://www.atarimuseum.com/computers/8BITS/1200xl/1200clrpic.html

About halfway through the work, I found a couple discrepancies, namely R188 was at least 900 ohms (I forget exactly, but it was over 900), and C62 actually had no component installed. Unsure why these differed yet still hoping the upgrade process was valid, I finished the work. My

only deviation from expected is that I used a 1/2 watt resistor at R188 because I didn't have a 1/4 watt in the right resistance. I completed the changes and checked more than once for any soldering errors.

So, I hook the machine back up and turn it on with a BASIC cart in the slot. The characters in text mode are indeed very sharp (and quite bright as well), but the left side of the blue background is completely grey for a few columns. Also, I stuck my Galaxian cartridge in and found that ALL colors there are basically grey tones (it's possible there is SOME color, but it's very subtle if there is). At least one other game that I put in DID show color, so I'm not exactly yet how to characterize the modes that will show the issue. I might have more to go on if the BASIC mode wasn't only partially corrupt.

Can anyone help me characterize what might be going on here? Anyone seen a similar issue and/or know what would cause this? I can take a photo of the screen results as well as each side of the PCB if that will help. A couple notes:

- I have a second 1200xl that I opened up, and it had the same discrepancies in existing components as the first one. I had hoped it might have matched the list in the instructions so I could see what else was different if the 1200xl shipped with 2 different video setups.

- While looking for more info, I stubled across the ClearPic 2002 mod at http://retrobits.net/atari/clearpic.shtml. I might have done this one instead if I had found it first. I might still do it, but I'm hesitant to think that it's going to fix my issues because I'm sure the mod I did was a solid performer already. Seems to me I must have some underlying issue that should be determined before making another attempt that requires more components. Then again, if anyone has had this same experience, perhaps you can give another view.

Thanks!

Don't have an answer for you but here is another link for the orginal
ClearPic 1200XL article. This copy has the schematic for the completed
video. Perhaps it will help.

http://www.geocities.com/atarimods/1200xl-vm.html.

Thanks for the link. It's interesting that there are 2 more components to
remove and that the replacement for C62 is different in this particular
listing. The text of the mod, though, is pretty much the same with the
exception of noting that it's 16 rather than 10 components to remove if you
won't be using the RF modulator. I see no further reference to the RF
modulator, and this parts list is now 12 components to remove. I do see
the note that this is not the same circuit that appears in AC (presumably
Atari Classics - the link I used).

You think things will improve if I change C62 and remove the other 2
components?

Beats me.

Seems to me in the article to which I linked, Bob calls for a variable
capacitor 1uF to 10uF for C62. I'm not sure I'm reading that right
though.

As for the difference in the schematics, I don't have access to a copy
of the complete original Atari Classics article. (I never had the
privilege to read Atari Classics until some re-posts became available).
 I am wondering if the original had the completed circuit or just the
1200XL original schematic.

I wish reprints/re-posts would include the date of posting and the date
of the original. Just a pet peeve.

Hadn't heard of it, but not surprised.

Of course, aside from that, simply logging into a bigger system (one with
a text-console-based IRC client) via IceT or some other terminal program...

    You know of any good servers I can telnet into that has IRC? (I don't think there is a IRC program for the Atari 8-bits yet).

    Other than that, you can also hit the java Ataritimes.com chat on Monday nights too, but the Atarinews chat is for the most part, there already, and run by an Atarian who is happy to run it. So why not?

    Naturally I liked the other chat room I was with around July of last year... fun place, but last I heard went down. :(

Well I verified that by swapping my 4.2 EPROM with 3.1 my programs begin to
work again. So there must be something going in there.

Thomas

Well after getting a proper cable I have determined I am not getting either Chroma or Luma on the 130xe. I have verified the transistors related to the video circuit are functioning properly. Anyone have any ideas?

Anyone know if there were multiple revisions of the 1200XL system board?

Hey James, double check R188's location. I'm looking at the 1200XL
schematic. R188 is 750 ohms but R138 is 910. Did you get them mixed
up?

Nope - I changed R188. In my machines, both of them are 910.

FYI - I got the problems cleared up by completing the enhanced enhanced
mod. The author made one more update after I asked him some questions:

http://sog.com/atari/1200xl-vm.html

I think the video can still improve, but it's better than it was - and no
grey issues.

Is there a particular revision of SDX that was considered "the one to use"?
I see there are at least 5 revisions, and I'm wondering which one I should
run with. Also, I'm assuming that cart uses a 27512 EPROM? I'd hate to
ruin the label by pulling it up from the markings on the chip. :)

thanks

It is because computer games these days aren't as fun as they used
to be. Why don't you open a classic Atari gaming cafe in your area
and let the vandals enter. When they leave, and that'll be late, they
will be happy and peaceful citizens.

In the January, 1989 issue of Atari Interface Magazine, there was an article "Install an Alternate Operating System in an XE." I'm sure that I've also seen this article on the web. This showed how to "piggyback" a 27128 eprom on top of the OS rom using a switch and pull-up resistor for selection. I tried this at the time, but never got it to work reliably. As I recall, sometimes it would boot, and sometimes it didn't. Has anyone else had success with this approach? It certainly *should* work, but didn't for me. On a similar note, has anyone used a 27256 with a switch to accomplish the same thing? Or has anyone done a "homemade" RamRod--type board with multiple OS? Thanks.
-Larry

How many people out there believe that life of old 8-bit systems and old 16-bit systems life will be spared because of Contiki? I believe this OS is the answer that all 8-bitters have been looking for. I think it offers more than just TCP/IP to old systems. It is a common ground for all 8-bit systems all the way from Z80 to 6502, a place where new

apps can be ported from one system to another with little modification.
I hope in the future we can see it grow. Maybe see the GUI abilities
advance on systems like the Atari, C-128 and Apple. See a version be
ported to run on a 32k TS-1000 with 1541 floppy drive. An apple IIGS
native version. and add in modules and drivers to take advantage of
home brew upgrades on 8-bit systems like CF cards and ram upgrades,
video tweaks, or accelerators. Or maybe versions that would run on old
CP/M computers like Northstar, or even Altair. How about include single
board computers like Apple 1 or Cosmac ELF? The future of 8-bit
computers is still wide open, and it is nice to see an OS like Contiki
to make them sore. So programmers develope for it, and make it grand.
Users, use it, and reap from it's benefits.

Some of the 16 bitters perhaps. Not the 8-bitters. They will survive on
their own merits but it will be fun to try Contiki, if only for the
journey rather that the end result.

There is some video of the C64 using Contiki to access Google at the end
of this video.

http://video.google.com/videoplay?docid=-4895240151804208219

>Maybe see the GUI abilities

GUIs first started appearing on the ZX Spectrum twenty years ago

http://video.google.com/videoplay?docid=-5899006623234946073

Since the Timex 1000 can achieve this resolution in software and since
peripherals, like ZX Spectrum mice, will fit the TS-1000 edge connector
then a GUI would be possible on the standard machine with memory
expansion.

It would be a bit Klickibunti though.

http://en.wikipedia.org/wiki/Klickibunti

The journey would be fun and I am sure some are planning it now :-)

These comments make a lot of assumptions, so I took time to respond and
comment. But as this message was posted to several Usenet groups, I'll
only respond in depth in comp.os.cpm where I normally hang out - that's
my own policy. Go there if what I say below is of interest.

My short reply is that, based on my experience with people dumping old
S-100 systems (1970's to early 1980's, CP\M, Z80 & 8088), is that not
many of those systems will be saved from the dumpster just because some
kind of new OS is also available for them. The biggest obstacle to
saving old, big systems is the reluctance of owners to pack and ship
'em! There are already other OS's to try on those systems from years
ago, a "new" OS is not revolutionary. I think most of the interest in
the computers I'm speaking about is in their OLD OS's - but more power
to those who want to soup them up, like building a hot rod from a
1930's car.

Contiki looks like fun, nonetheless. So thanks for the post!

Although First Star's packaging claims the screenshot shown on it (left pic)
is an "actual game screen" from the Atari version, it's not a screenshot
from the actual released version (right).

http://tinyurl.com/bj5pb

Now, the box for the PB version states for 400/800 only -- BUT if you look
on page 2 and/or 3 of the manual, it mentions using it in a 1200XL! Check
out the (awesome) atarimania.com site for pics.

I don't know much about the 1200XL as far as what it was or wasn't
compatible with (it's always been my understanding that it was practically
incompatible with itself...) but is it more compatible with the 400/800s
than with the other XLs?

I prefer v.4.19 when using a hard drive.

Some useful programs will exit correctly, that will not with version
4.21.

Just my opinion.

Phantomm

Runs OK on my stock 1200xl with no Translator, wow gotta love that music.

I haven't had very many compatability problems, not any more than with a
800xl anyway.

Actually, on my 1200xl I can run the disk version of Star Raiders with the
Translator. My 800xl will not run it at all! Not the version I have anyway.

Charlie

That's interesting... I have noticed a few problems with 3.5F and 4.2I, but
I haven't been able to pin them down yet, as I've been messing around with
a lot of different setups (2.5" drives, a CF drive I recently bought (this
rocks!) and of course, working on the utilities that I've written for MyIDE
(which often have bugs that I need to track down. ;))

So a 1200XL is more compatible with 400/800, but still not 100%, right?

I never realized that Star Raiders had a problem with XLs. And the FAQ site
I found doesn't list it either -
http://www.faqs.org/faqs/atari-8-bit/faq/section-59.html Years ago I
probably only had a pirate disk copy, and I don't remember needing to use a
translator disk to make it work. Now all I have/use is Atari800Win. I
checked through all the different copies of Star Raiders I have - some work
and some don't. So I guess Atari or someone else fixed it along the way.
I'm pretty sure that emu doesn't include the 1200XL with it's XL/XE option,
and I can't find any ATR copies of the translator disks.

I did find a version of Star Raiders with a title screen! It's obviously a
'home-made' modification - the screen is a (nice) picture of the Star Trek

Enterprise firing its lasers! This version is also compatible with XL.

That's an old trouble, the membrain inside the keybard is shot, I replaced
those many times when I had XL/XE's and the ST's have it too. The tracks
brake.

I don't know if it's more comptablie with the 400/800. Just making an observation, my disk copy of Star Raiders is no measure, the cart works fine on the my 800xl's.

I like it because there's no basic and it has a fresh keyboard, and looks nice.

You can find Translator here..

http://ape.dyndns.org:8083/MISC/TRANSXL1.ATR
http://ape.dyndns.org:8083/MISC/TRANSXL2.ATR

I don't have a copy of the 1200xl OS ROM, but I suppose I could get one out of my 1200xl if you really wanted it.

Where did you find the modified Star Raiders?

Charlie

I've uploaded it to my website now:
http://rjespino.tripod.com/8bit/dos25tb/dos25tb.html

I remember it was published in an issue in the mid 90s, it was a small
type-in and I think it wasn't even listed in the index (just to make
things easier ;)

I'm amazed I can still remember writing this, it's been sitting on a
floppy for around 16 years now.

>
> http://tinyurl.com/bj5pb

I checked a couple of internet sources, and I am still confused.

It looks as if the graphical contents of the top of the screen varies
between
one screenshot and another from the same platform.

http://www.atarimania.com/8bit/screens/astro_chase_first_star.gif
http://www.atarimania.com/8bit/screens/astro_chase_first_star_2.gif

I cannot recall seeing any moving planets when playing this game 20 years
ago, but maybe I am wrong.

Also, the font used for the first two of the three text lines does not look
like
the standard Atari font. I looked at a larger image of the cover art, to
exclude
the possibility that it was effects from the scanning process that caused
the
different look.

http://www.mobygames.com/game/c64/astro-chase/cover-art/gameCoverId,35187/

Obviously, the screen on the cover does not use the Atari standard font,

except for the third line.

I think line one and two are not based on a character mode, but on
the high resolution graphics mode. Look at the varying width of characters
in
the word "MINES" on line two.

> Now, the box for the PB version states for 400/800 only -- BUT if you look

What is the "PB" version?

Anders

Make sure your PDA/Hotsync software is shutdown. It may be taking over the
serial port.

At one point I was compiling a list of games that use artifacting but I
lost it.

>From memory, QS Reversi and Diamond Mine use artifacting for 100% of
their colors. If you use an S-Video cable when playing these games all
you get is black and white video. Use a composite connection or TV and
you'll see the colors (or at least you are supposed to).

Wizard and the Princess does 75% of it's color with artifacting.

Choplifter about 33%.

I can't seem to remember any others.

Try one of the first two games and Wizard and the Princess, the latter
because the game has an artifacting test at the beginning.

Did you run the APE Configuration Wizard? I presume it is included in
the trial version. That should help diagnose your issues.
Look under the OPTIONS tab of Win APE. BTW, where did you get your
cable -- the guy in Poland (who makes very good cables)?

Some other potential issues: what type of cable -- one chip or two
chip? What IC is used: 1489 (family) or Max 232(family)? Do you have
any other drives, etc. on the SIo daisy chain?

Kevin (and Shawn),

Thanks,

Those games are news to me for using artifacting, except David's
Mdnight Magic.

I'm starting a new list. Hopefully I won't lose it this time. LOL!

I wanted a list because there's no artifacting when using a S-Video
connection and artifacting in Atari800Win Plus looks bad.

There's probably a huge number of games that use artifacting but the
ones that look black and white under the above conditions really stand
out.

Xref: g2news1.google.com comp.sys.atari.8bit:1958

I recently purchased a SIO2PC cable from Ebay. I could not get it to
work using any possible config with WINAPE, so I contacted the seller.
According to him I need to have a floppy drive and DOS (an Ataridos)
loaded for it to work and that getting an Atari to boot with the SIO
is "tricky" he then sent me an email saying that I dont have the
proper equipment to use this (since I donot have a floppy drive) and
that I could send it back so that he could sell it to someone who

"know's Atari" and that I should have an "Atari" partition on the PC
anyway. He also said he used it with a 130xe/floppy drive combo
without any problems (this is like 10 years or more ago according to
him).

Is there any basis for what he is saying?   I am familiar witht he
8bit been using them since the 70's but this is my first experience
with the SIO2PC.

Any advise is appreciated.

     No. All you should need is the Atari computer and a PC with a normal

serial port. Booting off the PC is actually simpler than some setup with a disk drive and DOS already loaded.

I don't know what kind of SIO2PC cable you have, but if you drop me an e-mail at classics@atarimax.com I'll be happy to help you debug the problem. :D

Since the main purpose of this interface is to replace the floppy, that
sounds like a load. I have a cable that I use with APE, and all you need
is a bootable image in the first slot to be good to go. Unless there is a
miscommunication, I'd say the seller is likely confused about how things
have progressed in recent years with the availability of disk images.

According to an article in ANTIC, there is a simple mod that will allow a
1200XL to support the P:R: Connection. This mod is supposed to be detailed
in the manual for the device. Does anyone have a manual I could get a copy
from or know where it is already documented on the web?

thanks

I don't know what it is exactly, but I have a sneaky suspicion that all you
have to do is add the +5v onto the SIO port that the 1200XL lacks.

Adding a breadboard to that (instead of the solder pads) would make it
more appealing to a larger group id imagine. (though im partial to
xilinx :))

it would of been nice if Atari did some upgrades to the 8bit series over the years. Like for instance the AMY sound chip, and maybe even an 8bit with a faster CPU like the c128/Apple IIgs or somewhat advanced graphics while still remaining compatible with classic 8bits. Would of been nice, but never happened. Look's like we might get something like this in the FlashBack 3, but I would of been alot more psyched in 1986 then I am in 2005 for an advanced 8bit platform...

I recently read that IBM considered using the atari 8bit tech in the original IBM PC, now wouldnt that have been something? We would still in some way be using an Atari now!! Somewhere in our pc's we would have Atari 800 compatibility! the entire 80's and 90's would of been different because the PC would of built upon the 8bit architecture instead of the XT, then again, maybe it would of been a complete failure and we'd all be using Apple compatibles or some other platfom now!

There is still something about the my XE that is cool despite the fact my computer next to it is roughly 10 billion times better in every way, it is the Atari that I get excited about...

I'll be ordering the MyIDE + 1MB MaxFlash cart (as well as an 8MB
MaxFlash) in the next few days. I plan to use it with a CF adapter.
I have the 32-in-1 OS installed in my 130XE. It has versions 3.1e and
3.1i of the MyIDE ROM. How can I upgrade to the 3.5F and 4?

I had another quetion. Would it be possible to use the warp SIO
routines from Steve Tucker's Ape Warp OS in your MyIDE ROM? I have
gotten spoiled with the speed boost, especially since I got my entire
(original) floppy collection backed up and in ATR format now. I was
amazed that out of 193 disks totalling 24.2MB, I had less than a dozen
read errors from the floppies.

Speaking of breadboard vs solder pads, I just purchased a Microport XL
board. It is an experimenter's board that plugs into the PCI of the
800XL. It has a 6520/6830 PIA onboard, and a prototyping area. Since
I would like to make more than one project with it, I was planning on
soldering in wire-wrap pins to the prototyping area. I'll post some
pics when I get it all assembled (I didn't know I was odering a bare
board. I still have to get the parts to populate the board and then
assemble it.

Cool. I assume the resistor removal is allowing the +5 to get to the SIO
port?

Thanks to both of you!

I've put together my lame little drum pad for my Atari. It's made out

of household items: cardboard, aluminum foil, Scotch tape and an audio
cable. (Well, "household items" plus an Atari joystick cable.)

See photos, and don't laugh too hard :)

  http://www.newbreedsoftware.com/bill/photos/drum-stick/

Now, to find time to write software. :^/

Joseph D. Place <jdplace@removespamcableone.net> wrote:
> Can you give me an example of artifacting so I can test?

You can simply type the following program into Atari BASIC and RUN it :^)

```
10 GRAPHICS 8
20 SETCOLOR 2,0,0
30 COLOR 1
40 FOR X=0 TO 319 STEP 3
50 PLOT X,0
```

```
60 DRAWTO X,191
70 NEXT X
```

If you get alternating colors, it's artifacting.
If every vertical line is the same color (white/greyish), then there are no
color artifacts.

Hope that helps!

Ditto for regular Atari800 under Linux. The biggest problem I've seen
is that the artifact colors are always the same brightness.

So if you turn on artifacting, then do SETCOLOR 1,0,0, you'll still see the
edges of lots of the characters. :^/

I believe the artifacted pixels are always the same color, regardless of
the background color. (e.g., SETCOLOR 2,8,0 (blue) or SETCOLOR 2,0,0 (black),
the edge pixels are the same.)

I should dig around the artifacting code in Atari800 some day.
I doubt I'll make it anywhere close to "perfect", but hopefully much better
than it is now.

For now, I imagine it's "good enough" for most situations (e.g., many games).

I don't know if any of you have been following the remake of Archon (my
all time fave 8-bit game), but a beta has (finally) been released!

See http://www.archonevolution.com for more information.

I downloaded it yesterday and my brother and I have played it loads
already. We think they've capture the feel of the original perfectly,
although it needs a bit of polishing (in the next build I think).
Hopefully I'll get to play a few of you using the network game option
(2P only in this build)...

Reppy
(I am in no way affiliated with this release - I'm just a huge fan)

Hi Greg-
Just out of curiosity, does WinAPE run ok under "Soft Windows?"
Presume that the Power PC cpu has enough "oomph" to run it. (?)
Although IIRC, some Mac's don't have serial ports, so that would
require some type of solution, also.
-Larry

I just wish I could tone down the artifacting in Atari800Win Plus.

Don't know if this is true with Atari800 but in Atari800Win Plus the
GTIA color scheme for artifacting seems to be wrong compared to my
800XL. The CTIA colors are a closer match. I also find the general
colors are off. I need to set the Color Shift parameter equal to 55 to
get the hues close to my 800 and 800XL, though I leave the saturation
high, much higher than the real machines.

Emulator video is sharper with more vivid color but I still prefer
gaming on the real thing, Not sure why.

Check out the forums at http://www.atarimax.com/ and post a message for
Steve Tucker (classics) there.

>I had another quetion. Would it be possible to use the warp SIO

The ROM is Mr.Atari's creation, but yes, you can get high speed sio with
both the flashcart version and the eprom version. There is some discussion
on the Atarimax forums about using some loadable highspeed drivers and
we've been told that Steve Tucker has granted Mr. Atari the right to use
his high speed routines in the MyIDE OS (provided there is room for them.)

I thought I'd ask the qustion this time. Is there any reason to leave the
RF shield in a machine that will never be used for RF video output? I have
removed shields in the past as I've upgraded video and other components,
and I was curious if there is ANY other value to the shield besides
protecting the TV signal.

thanks!

Someone correct me if i'm wrong, but I believe maybe it's the 130XE if you
remove the rf device it kills the composite. Not sure.

I don't want to remove the device, just the shield. What I'm not sure
about is if there are any other circuits susceptible to the same
interference it is there to protect.

AFAIK the RF shield is to restrict emissions from the computer, not the
other way around. It's to protect nearby TVs and radios from
interference.

Most people have cable TV but if you happen to live in an appartment
then an unshielded computer might cause big problems for your
neighbors.

Even with cable TV I noticed that my unshielded 800XL throws off enough
noise to affect channels 2 thru 6 from anywhere in the same room. My
unmodified 800 doesn't do that.

You could get Steve to help you. I'd suggest getting your money back, since
the seller is willing to do it, and buying one of Atarimax(Steve Tucker)
interface. The Atarimax interface is a SIO2PC/APE and a PRO interface.
Steve may have one for sale on ebaY.
(I have no connection to Atarimax, other than being a satisfied customer.)

Ah - I didn't know that, but I buy it.

Perhaps I'll do a little testing around the house then.

I may have to remove/alter the shield anyway if I decide to stick a hard
drive in. This is a 1200XL, by the way - in case that makes any
difference.

I get the alternating colors. Thanks Bill!

For those following the thread I'll list the hardware here. I don't
think I listed it correctly in the previous post:

130XE composite video, to Viewsonic Nextvision N4 video box composite
in; Viewsonic VGA out to Balance 19" LCD monitor running at 800X600.

I used to play a game on the Atari 600xl. It was a tape based game when
you had a number of connected boxes that you moved around and when you
had moved along all 4 sides of the box it would fill with color. The
object was to get all the boxes filled and move to the next level.
While trying to fill the boxes you would be chased by enemies (they
looked like sparks). It is not Qix where you had to draw closed boxes,
it already had the boxes drawn on the screen. Anyone have an idea what
it was called? And even better if it is available online anywhere?

changing for the sake of change is not a good thing and that is the
way of giant software companies. updating is quite another story. sure
updates would be welcome and I am all for that. I should have been
more specific and not said pc but more just referenced that
monopolistic company that loves to change and break things. the pc
hardware has had great backward compatability thru the years and I
still use some of my 8 bit ISA cards in a machine with PCI slots and 1
ISA slot. amazing they did that.enough for now.

But by the time the Apple //e was coming around with 128K and 80 columns,
the Atari 8-bit line wasn't working! The 1450XL needed to be released with
80 column support.

Here is my guess:

An incredibly addictive computer game with simple but atmospheric
graphics. The game you are looking for is "Drelbs", by Synapse
Software.

http://www.atari.online.pl/v01/index.phtml?ct=katalog&sub=D&tg=Drelbs#Drelbs

This sounds a lot like Drelbs, but I thought Drelbs is an OS 'A or B' game
and not for the XLXE.

Yes, you can run TBXL with the ROM OS. I got the MyIDE kit Friday and
stuffed it in my 130XE (god, desoldering my CPU and OS SUCKED), and that was
one of the first things I did, give TBXL a whirl. Works great. You can run
it straight off a partition instead of having to copy it to the image space.

> Sounds like Kid Grid to me!

Just downloaded Kid Grid - it was very similar to that - but the
graphics were better and the boxes bigger. I looked at Drelbs - that is
not it.

I know this disagrees with some of your other observations, but when you
say the enemies looked like sparks, I come to think of another game made
by Synapse Software - "Rainbow Walker".

This C64 screenshot (follow the link) has one of the enemies on screen.

That's good news that artifacting works on your LCD!

Are you happy with the Viewsonic NextVision N4? I have mixed feelings
about the obsolete Viewsonic VB50HRTV.

Ever since you brought up the subject of a black and white monitor I've
again been thinking about doing the old monchrome mod for the 800XL.
I've got an old PC monochrome (amber) monitor (MDA) that hasn't be used
for two decades. (I can't seem to throw anything away! LOL)

800XL to MDA only needs a couple of IC's. Doesn't look too bad.

The XEP80 to MDA mod looks even easier, no ICs. Of course, who still
owns an old MDA monitor (besides me, LOL).

I'm looking for a utility that provided a list of the procedures that
are actually used when one compiles an Action! program using the OSS
Runtime library. The utility made it possible to abbreviate the
runtime library and use only the routines that your program requires,
saving memory in gobs.

I don't remember the name of the utility or where it could be found
orginally. I want to say it was a type in program from some magazine.
I'm not even sure it really existed. Could just be wishful thinking on
my part.

Does anyone recall such a utility for Action?

Yep! Doing an XL Search search for "action runtime", sorted by Matches,
I found this:

  "Here is Jeff Reister's PD Runtime package for the Action! 8 bit language."
  http://www.umich.edu/~archive/atari/8bit/Languages/Action/actrun.arc

And this appears to be a straight ACT file, in ATASCII:

  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RUNTIME.ACT

Good luck!

Thanks Bill, but the those are both alternatives to OSS's runtime
library SYS.ACT.

What I am looking for is a symbolic reference tool, if you will. This
tool lists which runtime routines are referenced by your own program.
With that knowledge you can shorten the runtime source and thus shorten
your own compiled code.

Oh! Duh! I didn't read closely enough, obviously. Sorry! :^)

Over at the CTH mirror at ftp.spudster.org, I see:

  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/ACTRUN.ARC

Along with it is "ACTRUN.DOC" (a plaintext file) which states:

     Additional programs not included here because they are binaries:

      RTSCAN.COM - run against your source file to produce a listing
                   showing which RUNTIME.ACT routines are actually required
                   by your program. Allows you to trim out unneeded
                   routines to save symbol table space, etc.
      RTWRITE.COM - If you send the output from RTSCAN.COM to a disk file,
                   you can then run RTWRITE on that file -- it in turn
                   outputs the trimmed down version of RUNTIME.ACT for
                   you.

And lo and behold, it looks like at least RTSCAN.COM is available in the
same FTP directory. One is an ACT file, and then there are 3 COM files
for some reason:

  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN.ACT
  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN.COM
  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN2.COM
  ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN3.COM

I hope _that's_ what you're looking for! :) Good luck!

Yes, the Viewsonic NextVision N4 has worked great for me. It was
expensive, but it's a great option for hooking up A8 to VGA monitors.

Hey, may as well make use of that MDA monitor for something
worthwhile!

That's cool. I wonder if some sort of Atari DDR game could be
constructed using SAP tunes...

The chip on the XF551 board is burned. The chip number is SN74LS38N by
Motorola U8721. I wonder if SN74LS38N by Texas Instructment works with the
XF551 board. Any help?

It should be a drop in replacement, but you should look at why the thing
burned out too.

Mark

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

RELATED NEWSGROUPS:

It is overheat... :-(My Atari 1050 US doubler is overheat too. Drive #1
does not work. Switch to 2, still doesnt work either but 3 and 4 drive work!
I smell no burned chip on the 1050 board. How do I find chips that control
the switch?

Thanks!
Jack

I'm having a senior moment so...

I seem to recall the RTSCAN did not pick out everything you needed from
the RT library. Just something simple like you need to include
copy_parms() even though it isn't listed. There is also ~BIGSYMBL or
something like that to give you a larger symbol table. If your program
grows to 16k or so you will probably need it.

There are work around for the symbol table if you can't find the
utility. Mostly you use definitions to eliminate procedure calls.

That is my hope! :^) Dunno if _I'll_ ever get around to it, but... :^)

At the least, I might make a simple little drum machine tool, kinda like
Syn, but simpler... and for drumming. :^)

Or better yet, how about using the 1010/410 recorder to play actual
music?   YOu could make a template for each song on the tape so the
screen would be synchronized to the music.

I'm pretty sure I finally got rid of my 1010 tape drive. :^)
But yeah, that's another possibility. Of course, that lowers the number
of potential players to those who (1) still have a 1010 drive and (2) have
the same audio cassette as you. ;^)

THESE days, it might be easier to whip together some kind of
SIO2PC-cable-controlled music player for Win/Linux/Mac and provide MP3s or
OGGs for people to play. ;^)

well the cassette would be part of the package or like you say the MP3
which would prob be better off. Can you emulate a cassette recorder
with SIO2PC, you could do the same thing then?

That's too bad about RTSCAN. It sounded so promising.

I'm slowly getting a feel for which Procedures/Functions I can leave
out of the runtime but it's a pain. I was hoping RTSCAN would help.

Already had to increase symbol table space for one of my programs but I
also already forgot how I did it. [Guess that's my senior moment...but
I've got a few years to go]

Thanks for the help.

Hi,

74LS38 is the Id of a standard logic chip; they are all alike, regardless
of the vendor.

> It is overheat... :-(

But if so, check why. If the chip has to provide more power, then try to
replace with a 7438 or 74F38, which are able to drive more current than the
LS variant. They're otherwise compatible.

> My Atari 1050 US doubler is overheat too. Drive #1
> does not work. Switch to 2, still doesnt work either but 3 and 4 drive work!
> I smell no burned chip on the 1050 board. How do I find chips that control
> the switch?

The switch isn't controlled by a chip, it is rather read by a chip but that
doesn't have to draw much power. The 1050 drive ID switch consists actually
of two independent switches: If it works as drive 1, and as drive 3 and 4,
then something else is wrong with your SIO chain because that means that
both switches are working. One can't encode three Ids with one switch.

So long,
     Thomas

The thing about RTSCAN is that as the programmer you will know
everything it will tell you. For instance if you do Graphics() procedure
call you will know you have to include that from the RT library. I found
the time it took to save, run RTSCAN, go through the list, copy the
procedures from the RT library, etcetera, to be the long route for me. I
got really good at using the two window feature of the Action! editor as
well as the copy buffer. What I would do is just do a split screen with
my program in one window and the RT library loaded into the other
window. I would just use the cut/paste feature of the editor to move
from one window to the other with the procedures I needed, then delete
the RT library window.
>

It becomes natural after a little while. I have a good example of doing
it somewhere. If I can get the little woman out of my hair for a couple
of hours I will post it.

I have both Archons and have played them many many times. I would love to play this new version. Can you upload it to me? I could not find where to download the beta from.

Well after somewhat popular demand, I have put my BBS back up.

The Electric Cafe'

Telnet over to thecafe.dtdns.net and use PORT 8888

Everything is still intact. I have moved the equipment to my office to make it a bit easier to manage.

Thomas

Hi;
I picked up another 800XL today and it is SOCKETED!!! Looks pretty clean
too. I have 1 slight problem with it. Starting with key '7' and moving to
the right, all keys to the right of 7 do not work. 1 thru 6 are fine as are
ALL other keys on the keyboard. Weird huh?

I tried cleaning and swapping the keyboard with another one - no luck. I was
wondering if anyone else had ever seen this behavior?

Thanks

Logged in this morning (early), looked around. Looks good. I was wanting
to ask a few questions, if you don't mind. Some of the games you offer?
Are they 8bit? Examples, TLORD and Tradewars 2002.

Thanks!

It sounds like you connected to my other BBS which is run on an IBM. If you
don't specify port 8888, it will default to telnet port 23 and connect you
to Hodge Podge II. So no they are not 8-bit ;)

Thomas

AFAICR they were on tape/disk.

I'm not extremely versed on this - can you give a brief summary or point to
a URL on the incompatibilities that exist?

thanks

The main incompatibility was the 16k rom versus the 10k in the 400/800,
though there was a translator disk that let you solve that. It has been
awhile since I last used an atari outside of an emulator (or the 2600)
so I don't remember them all. I recall in Mapping the Atari there was a
number of things that they said were different on the 1200xl versus the
others. This site details a number of the rom differences:
http://www.atariarchives.org/mmm/appendix_eleven.php

This site shows the differences in the Parallel Bus interface on the
1200xl:
http://www.retrobits.net/atari/pbi.shtml

I'm using a Paradise video box similar to what you are using. No

DVI, just VGA out. FYI O/T I use the same box/monitor for monochrome
for my 1040STe with a VGA converter for ST on the VGA input.

Only good reason to get a *stock* one is they come with a good keyboard.
I have an 800, 130XE, 800XL, and I prefer the 1200xl keyboard.

The incompatibility was a pirate and phoney marketing thing. Some of the
early hacks like CARTCOPY had an illegal jump to the OS. The real carts
would work just fine but the dozens of pirated pieces of software would
crash on a 1200XL. IIRC a lot of that copy stuff came from Gardner
Computing and it was his habit at the time to make that illegal call.
For that matter the same hacked software would crash on a 800XL too. I
think if you look at the software that legitimate users call
incompatible you will find it is a much shorter list.

That is also why "The FIXXL" worked/was written. It just loaded the 800
OS into an XL then prompted the user ~"Insert disk and press return".
That was because all the cart images were on disk.

The 1200XL is a hackers dream, they are fully socketed. None of that desodering RAM to add a memory expansion like Rambo. Something goes out, just plug in a new chip. If you have ever tried to trouble shoot an 800XL where one of the 40 pin chips went out, you really learn to love the 1200XL.

There is a lot of real estate under the hood. The 1200XL uses just a chip or two more then an 800XL but has a huge footprint. Bob Wooley even pulled the 5V power supply<and RF modulator?> from his to make room for his mods.

Bob's mods are a major reason to use a 1200XL. He has done everything from upgrade the video to built in BASIC to internal IDE drive. Some of it is kind of esoteric, like the OS comes in two 8k ROM and has provisions for either 24 pin or 28 pin devices: Makes it easy to put in multiple OS by substituting 27128's then adding a few jumpers and a switch.

Better than the 800? I'll be interested to see that then.

I was fortunate enough to have a socketed 800XL, but I certainly lost
any desire to mod my 130XE after I opened it up and found 0 sockets.

Yeah, I had figured that much out - it's a nice size mahine for cramming
stuff into.

I didn't realize there's not built-in BASIC in the 1200XL. What's there
instead, if anything?

Personally, I've thought it'd be cool to get a Serial Port CF card for
my Sharp Zaurus (they're ARM-CPU-based PDAs running Linux 2.4 kernel)
and try buidling AtariSIO and AtariServer for it.

Earlier this week, I saw a presentation from a fellow from JK Microcontrollers
in Davis, CA who are about to launch some 4" x 4" microcontroller units
that are also ARM-based and run Linux.

Get a little mutli-gigabyte CF micro hard disk, some batteries or
a power supply[*] to power it, and an SIO2PC cable, and you SHOULD be
set.

One day I'll play. :^)

[*] Interestingly, JK Micro's devices (their earlier ones are MSDOS-based
    embedded systems in similar form-factors) appear to be powered by old
    Atari computer 5V power supplies. :^) I forgot to take a photo of
    that. Here are photos from the LUG meeting (you'll see me in one!)
    where you can see the Linux microcontroller.

      http://www.lugod.org/photos/2006.01.16/

    It'll apparently cost ya $150-200 at Qty 1, though!

I see that the 8 Bit Baby is available for the 6502 machines, is it cpu
dependant or can you use it with Z80's like the TS1000/ZX81?

Heh, what I hate is when apps check for PAL or NTSC and tell me I can't
run the program, despite the fact that I have a PAL _ANTIC_ installed.
(Just not a PAL GTIA or OS ROM!)

:^P

Thanks for the response. It's taken my barely-perceptible machine language
knowledge several days of revisiting your post, but I think I get it now!

BTW, there's a nice illustration of this here:
http://homepage.ntlworld.com/kryten_droid/Atari/800XL/atari_hw/gtia.htm#NTSC/
PAL%20register

>(Just not a PAL GTIA or OS ROM!)

That's one of the reasons I'm trying to revise this info in the FAQ in such a
way that it's clear why this situation would happen.

Any software check for PAL or NTSC would technically be sensing whether it's a
PAL or NTSC GTIA that's present. My understanding is that there's no
difference detectable in software between a PAL ANTIC and a NTSC ANTIC.

Someone please chime in if this in incorrect!

-Michael

Hope this helps someone. I find low-cost cables here:

www.cablesnmor.com (USA)

Null modems starting at $5 for 6-ft lengths.

It is just a prototyping board and is not cpu dependant. I am not sure
what connector is used for the Z80's but if the board can be plugged in
then it can be used.

THERE ARE NONE! At least in my personal experience. As a matter of
fact, the 1200 XL is most likely the best computer that i ever owned
based solely upon its compatibilty with all the other Atari Systems
that I owned previously.

Isn't there a cartridge out there for the "ATARI SERIES" computers
(400,800,1200, 130, etc.) that has a basic eprom in it and that allows
you to run utils on it through the built in parallel bus i/o? I saw it
a few times in CLEVELAND, OHIO on Ebay!

> Someone please chime in if this in incorrect!

Well, there's no single register in ANTIC that tells you whether you're
running PAL or NTSC, that's about right. However, there's still the
chance to find out, namely to check the maximal value of the YPos
(vertical beam position) register. For PAL, it runs up to 155 (312 lines
in PAL), for NTSC it only reaches 130 (262 lines for NTSC). Thus, in principle,
also ANTIC tells, though the procedure is a bit more cumbersome.

So long,
     Thomas

So ? Finally it's GTIA producing display anyway, setting colors etc.,
so checking what system it works in is proper. Bad is only the way
program reacts :) cause never should tell that you cannot run it.

In XL/XE computers there is no PAL or NTSC OS ROM. Both versions have the same
OS. It is about the time to already know that, Bill.

Well,
what you are thinking about is the SIO2USB project by german Atari group
RAF (a regional group of ABBUC)... it is still under development...
hopefully it will be finished this year...   greetings, andreas
Magenheimer.

Well,
for Dos 2.5, MyDOS 4.50 and 4.51 use Autorun.Sys, for newer MyDOS
versions use *.AR0 instead...   greetings, Andreas Magenheimer.

I put an embedded computer in an old Nintendo. It's slow (233mhz) and really designed for Win CE, but I put XP and a bunch of emulators on there. I have Nintendo and Sega emulators, but what I really wanted to play are my old Atari games. I have images of most of the games I had and I downloaded a copy of Atari800Win Plus.

The problem is that every time I load a cartridge image, all I see is the Atari logo on the screen for the respective system that the cartridge is for. How do I get past this to play the actual game? I'm very confused. I also got a copy of Stella for the 2600 games. It's much easier to use, but too slow for this processor.

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Atari Goods from oblivion, step up and buy a
minimum of $100.00 of ANY Games/Software in my Classic Atari 8 Bit and/or
Atari ST Catalogs and get 20% off! E-Mail or call Ben at (503)256-9974!

http://BensCatalogs.Atari.org   5 updated Catalogs!
http://www.aracnet.com/~atari/newinbox.htm   New Atari stuff!
http://www.aracnet.com/~atari/specials.htm   Details on Sales!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi,

> Can someone explain what the difference is between these? The best
> info I've found on the internet is that OE is faster, but takes more
> power.

That's about it. OE only drives the power of the output stage of the
chip. If it is disabled, but CE is enabled, the performs the decoding
of the input address, looks up the contents and places it on its output
buffer. But because the output buffer is not enabled, the data does not
appear at the data pins. With CE low, the full chip is inactive.

For the rather low frequencies within the Atari, it shouldn't make any
noticable difference whether you use OE or CE.

So long,
     Thomas

Atari certainly didn't lack when it came to investing in R&D. If anything,
they invested too much into it, b/c most of the things R&D created were
never used.

IMO of course but that opinion is shared a others. For instance I read a
story that Bill Wilkinson did DOS XE on a 1200XL because he liked the
keyboard best.

Me too. The 130 is a nice machine, maybe the best video output and
better functionality then any of the stock machines. I've even heard
some people like the feel of the keyboard.

<snip>
> I didn't realize there's not built-in BASIC in the 1200XL. What's there
> instead, if anything?

Nothing. A stock one just goes to an Atari logo with scrolling
colors/attract mode if no cartridge is inserted.

At one time I had what was apparently a prototype: The attract mode
listed maybe a dozen people that were on the development team. In a
confused momment I converted it to an OMNIMON OS and lost track of the
original ROMs.

I finally recieved the cable in the mail today. I decided to go with
WINAPE (the trial version) to test it out. I ran into problems
immediately, I have one serial port (com 1) and the WINAPE says "it
cannot find a cable attached to this computer" altho it is attached.
There arent any directions how do I get this thing to work? I am all
set with the 65xe next to my pc and a nearby television, but still
can't play Zybex!! Winape does say "Com 1 detected" at the bottom of
the screen once it loads up, so it must be a config problem right?

BTW I know the com port works properly because I have an old Palm PDA
which syncs to this computer via the same serial port.

any help would be appreciated.

My system is a pentium 4 running Windows XP if that helps.

thanks
Kevin

Which style of wiring does your cable use? There are two different options
for one of the connections, and you can set that option within APE. My
first suggestion would be to find that option and switch it to the other
setting (RI vs DSR).

By the way, there is APE documentation somewhere on the same website you
downloaded the trial version from.

All mine says on the outside is "Sio 2 PC design 6"   how can I tell
which type I have??? Do you know what "design 6" means? I tried
googling it with no luck.   I understand this model is fairly old, so
that might give somone a clue.

Try Options>Ape Configurations then try different values for Serial
Control. Ring Indicate is the default. The other options are DSR and
CTS. Basic SIO2PC cables usually only have one line wired.

Oops, clicked Post Message too soon.

Regard the reference to "Design 6". Just a guess, but that probably

means Pin 6 of the DB-9 connector, meaning DSR is used for Atari
Command.

Is your Palm PDA software running in the background? It could be
interfering with the other program when it tries to talk to the com

port.

I was waiting for someone to ask this as soon as I mentioned it, no it
isn't. Im gonna give this another go tonight. Im dying to get this
working.

Ive tried all three settings.   Im not sure Im doing this right. I
have the 65xe off, I select Spartados utility disk for disk 1 then I
turn the 65xe on and nothing...   Am I doing something else wrong?
Niether CTS, RI, or DSR seem's to have any effect. All I get is the
rasberry sound the Atari makes as if nothing is attached???

I see. Guess I was hoping that there was a similar product for DVI :)

Do LCD panels do a decent job with A8 artifacting? Just curious.

Well poop. It sounds like you have done things correctly. Those cables
have been known to go bad in surges and such. You said this cable was old?
Or just the design is old? At any rate, I would drop Steven a line and ask
how you might go about testing.

Yep! Just like I said: "I hate [...] when apps check [...] and tell me
I can't run the program."

Heh, sorry. :) I couldn't remember if it was in GTIA or OS ROM, and
I'm too lazy/tired/busy/not-caring-enough to double-check. ;)

Besides, I don't check that bit, since I write everything for NTSC,
so they should run well enough on PAL. ;)

Try re-runing the Auto configuration wizzard in the Options section.
However, if you are not seeing any Atari commands in the diagnostic
window of APE then I'm afraid Steven Tucker is the guy you want to talk
to. He is the author of APE.

Sorry, I couldn't be much more help. I haven't used APE since I
started using AtariSIO.

Way back when I had cable troubles, with a homebrew SIO2PC, I
downloaded the latest version of SIO2PC 4.1x something or other along
with some good utiltities for diagnosing communciation problems. Not
sure it will fix anything for you but it might show whether your SIO2PC
cable is valid.

Unfortunately SIO2PC is a pure DOS program. It kind of, sort of, works
from Win98 but I doubt it will from XP. You also have the problem of
how do get the diagnostic sender program onto the Atari if your SIO2PC
cable isn't working.

That's about all the ideas I have for what it's worth.

Yes..

I would also like a way to format a partition other than 16mb when using
SpartaDOS. Maybe one where you could tell it how many sectors you were
formatting and it would do it.

Hi people,

While looking at some of my old Atari User issues, I thought I might
check out some games I couldn't find when I was younger. Surpisingly,
although I have downloaded lots of images, I can't find some games.
Can somebody help?

Rick Hanson (text adventure) from Robico Software
The search by Red Rat Software
Slioh by SSI
Missing... One Droid by Bug-byte(??)
The pay-off
Spooky castle (the version I got freezes on Atar800Win PLus 4)
Escape Part I & II by AD400
The travelling circus by Infocom
Jackal by Konami (actually I only saw this on an advertisment, dunno
if it was converted to Atari or not)
Beaurocracy by ???
Gangsters Ville by Lindasoft
Trans-robots on the skull planet: last battle by Lindasoft

TIA!

I think the speed issue is not necessarily a problem for everyone; I
personally quite like the idea of supplimenting the Atari hardware
rather than souping it up. And you've got to keep that beep beep noise!

> My main reason for using the dos version is it will load faster (takes forever to load windows) is there some great advantage to using the Windows version of APE? <

It depends... To me, the "point-and-click" ease of Win APE far outweighs any loading issues. Win 95/98 loads very fast, and Win APE is fully functional with W95 or W98. Naturally the more stuff that loads at start-up, the longer it takes.   I sometimes use Win APE with a small, older Pentium 266 Mhz laptop, and W98 boots on it in about 45 seconds. So, to me 45 seconds is not an issue. I've used registered versions of both Dos and Win APE, and to me there is no comparison. But that's just my opinion.

But I still wonder how you can use a laptop with no hard drive for APE at all. You can do that with SIO2PC, but even the Dos version of APE requires a HD, according to the manual. Perhaps you have figured out a way to do this.

-Larry

the laptop has a harddrive, what would be the point of using a
computer with SIO/2PC without one?   It just does not have a cdrom
drive, and so I need to use floppy disks to copy all the .atr files
over.

If you have Win95 (or better) on the laptop get a null modem cable and
transfer the files using Direct Connect to the laptops HD from the
other PC. Will take awhile but much faster than the floppy. If you only
have Dos, try using interlnk, Intersrv to do the same in dos mode. This
is how I installed Win95 on a laptop with no CD and a bad floppy (dos
interlnk / intersrv). Took all night to transfer the files at a maximum
of 9600 baud but it worked.

The right spelling is - and I had to check that before I
answered - "Bureaucracy". It's an Infocom game.

Last week I ordered a MyIDE from ATARIMAX, and plan to use a 32MB
Compact Flash card on my little ol 800XL. I am used of useing DOS 2.5
on my trusty 1050 on the Atari, but have grown to love Windows XP on
the PC. Please no flames about XP ;)
Anyways I been reading up on differant GUI's and DOS's. So far I think
a GUI would be nice to have, and have thought about ATOS, Diamond GOS
3, and Contiki, as far as DOS I am narrowed to Sparta, and Mydos.

What I would like to do, is set up subdirectories, and have one be for
Atari Basic, Turbo Basic XL, Machine language. I would like a setup
that would load most machine language programs on the market, and APX
games and whatnot, and load and run Basic, and maybe even Turbo Basic
programs.

BTW are there and IDE/CF adaptors available that can plug into the PBI

slot?

I had a null modem cable a million years ago, but I have no idea where
it is now. Today I went to 2 Radio Shacks looking for a 5pin DIN so I
could make a monitor cable for my Atari with no luck! I couldnt
imagine finding a null modem anymore.

They still make / sell them - May be called a PC - PC direct connect
cable. If you have an old laptop you may want a serial one though

instead of the parallel (unless your parallel port can do
bi-directional).

Radio shack still carries the 25 pin null modem adaptor:

http://www.radioshack.com/product/index.jsp?
productId=2103637&cp=&kw=null+modem&parentPage=search

You would need that, along with 2 db9 female to db25 male cables and a
db25 gender changer. I use this setup here and then use Hyperterminal
in Windows XP & 95 to transfer files back and forth to the old laptop
at 115kbaud - works pretty good.

Or - you can just make your own. Get a 6ft db9 - db9 serial cable, cut
off insulation (without cutting wires) and then using a voltmeter to
determine which wire is which, then just cut and rewire as in this
diagram:

http://www.lammertbies.nl/comm/info/RS-232_null_modem.html#full

Or - 3rd option, if you have a pcmi slot in the laptop, get a pcmi
network card and network the 2 machines (if you have a network card on
the other).

Or 4th option - if you have USB on the laptop - get one of the usb
thumbdrives and transfer the files to it / then to the laptop

Out of curiosity, did you get a ROM chip with your MyIDE, or were you
going to run it off the cartridge?

I'm currently doing the latter (so it swaps Atari OS ROM out of the way
and uses RAM-under-ROM for the MyIDE stuff), and therefore I can NOT run
TurboBASIC XL (or any other XL-only software, including many games and demos).

I believe if you simply get the OS ROM, that allows many more things to run.
(Of course, not _everything_. Some things still require the original OS ROM,
since they were coded in a not-so-proper fashion ;^))

I'll throw in a plug for my favorite place to buy cables:

http://www.cablewholesale.com

I buy from these guys all the time, and I have never been disappointed.

Ok, on XL/XE machines, I believe we can ? PEEK(98) in BASIC, zero means we
have a NTSC GTIA, 1 means a PAL GTIA. Correct?

How is the equivalent done on the 400/800? It looks like location 53268
(decimal) is supposed to do it, but I don't seem to understand the results.
Memory map sources mention values of 0 for PAL, or 13 or 14 for NTSC, but when
I PEEK(53268) I get 1 or 15, respectively. What am I doing wrong?

Were these supposed to be on cartridge, or were they cassette or disk?

Do you have any XF551 Diagnostic program to check the XF rom if XF rom is
ok? Because the XF disk drive can not read/write/format the disk.... : (
Any help?

Thanks!
Jack

> On the Happy utility menu of the Warp Speed software disk, there is an option
  to enable US Doubler emulation. That will change the drive to US Doubler mode
  until you power cycle the drive. <

Hmm... I never knew that you could just take the Warp Speed Dos module (Autorun.sys) and use it with other Dos types. Live and learn.

The Happy docs are somewhat vague about exactly what you get with Ultra Speed Emulation (other than *slightly* faster speed). I'm not a frequent Sparta user, but even with US emulation set, I've still never been able to format a disk with Ultra Skew under Sparta X. Has anyone been able to do this? However there are some other utilities that allow doing that. -Larry

Exactly, Bill.

You can't run TurboBasic XL or SpartaDos. With the eprom MyIDE OS you can
run SpartaDOS and probably TB XL (never tried myself.) Here's where I plug
Steve Tucker's 32-in-1 OS upgrade (http://www.atarimax.com/). Gives you
the MyIDE OS plus a bunch of other OS, some very useful, some just sort of
goofy but cool to check out once in a blue moon (Arabic OS!)

Also should have mentioned... this doesn't affect a lot of people, but a Happy drive has somewhat limited functionality with a Black Box. For instance, if running a BB with the XL/XE OS, the Happy will produce an occasional error 139. And if you run the diagnostic while in the XL/XE mode with the BB attached, it will fail the diagnostic. If you use an 800-type OS in Rom, it will pass the diagnostics. And SOT, when programming a flash cart with the BB attached, it will produce an error just about 100% of the time (at least mine does). -Larry

Will start off with basic interfacing mods (printers, mice, light pens, etc.) and will gradually move up to video projects and power supply projects that will require a bit more "finesse."

Thanks for asking!

Charles

A decent design of a parallel harddrive interface for Atari does not require "special drivers or OS patches", either.

> have a NTSC GTIA, 1 means a PAL GTIA. Correct?
> How is the equivalent done on the 400/800?

I think (altough I don't own 400/800) it is done the same way,
cause it's OS job to set that memory cell based on GTIA
register $D014

> It looks like location 53268

that one ;) where bits 1-3=0 or 1 depending on what system is it.

> Memory map sources mention values of 0 for PAL, or 13 or 14 for
> NTSC,

Yes 0 or 14, but after AND #$0E (must clear bit 0).
1 and 14=0 , 15 and 14=14
 .
> I PEEK(53268) I get 1 or 15, respectively. What am I doing wrong?

Treat that value as OS does - and #$0E, then zero or nonzero.
Best that way, cause I am not sure if always ALL bits 1-3
are 1 on ALL machines, but it's sure that all of them are 0.
OS is checking that way (below).
So after AND it may be 0 or 2,4,6,8,10,12,14 ;)

```
    LDA $D014
    AND #$0E
    BNE NONZERO
    LDA #$05
    LDX #$01
    LDY #$28
    BNE ZERO
```

```
NONZERO LDA #$06
    LDX #$00
    LDY #$30
ZERO STA $02DA
    STX $62    - and here you see OS is setting cell at 96 to peek.
    STY $02D9

If 400/800 OS is not doing it then you just have to do it yourself.

               Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers!  These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.  Atari, based in Sunnyvale,
```

California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Rewiring a USB dance pad to work with the atari joystick port is really
easy, I did it a while back to make a floor controller for my kids and
just wrote a simple program to play a musical note when they stepped on
the pads so they could stomp around and make horrible music.

It is a really easy interface job, for programming, just assume the 8
directions on the joystick, or four if you want to keep it simple.

Unless you have the older Happy Rom, it is already built-in compatible
with the US. Doubler. And you get Warp/Ultra speed with any DOS (or
software) that supports those speeds.

If you have the older Rom, then you have to enable U.S.D. emulation with
the happy software. Boot the happy software, select Drive options, and you
should see an option (Enable U.S. EMU, or something like that).

The Happy doesnt support the 'f' command for formatting with custom skew.
You dont need this at all with the Happy. As long as it is in fast mode,
the happy drive will read at exactly the same speed any disk disregarding
the skew. So there is no reason to use that option unless you want to use
the disk with a drive enhanced with the USD.

>got didn't have anything written on the top of the ROM chip...

Run the diagnostic program in the Happy software rev. 7. It might work
with older version, I dont know for sure. But just in case use 7.0 or 7.1.
Select the option to test RAM and ROM, I think its called Enhancement
diagnostic or something like that.

After the ROM test, there is a word that shows all in uppercase if you
have the newer ROM, or capitalized if you have the older one. I dont
remember if the word is ROM (Rom), PASS (Pass), or TEST (Test). But this
is described in the rev. 7 software manual. I will look it up if you dont
have it.

As a last resort just try using an older Sparta Dos version without enable
U.S. emulation. If you get the Ultra speed, then you know you have the
newer ROM. Note that newer versions of Sparta, like Sparta DosX have a
driver specific for the Happy that enables U.S. emulation. So you must use
Sparta 1 or 2 for this test. And make sure you power-cycled the drive
before the test, otherwise your drive might have been already programmed
with the U.S. emulation

In case anyone is looking for a monitor for their XEP-80, I discovered that Walmart sells an inexpensive security monitor and camera for about $45.00 that will display all the characters. It's a black and white 5.5" monitor, so it's on the small side, but it was exactly what I was looking for because I have a very small work space, mostly because I'm using a 19" LCD for a color monitor for my 130XE :-)

What 19" LCD brand (and how much) did you find that will cover the 15khz
range needed?

5.5 inches? Yikes!

I've been using a 9" security monitor off and on since the early 1980's
with my 800. It's great for 40 columns but I can't imagine using it
for the XEP-80's 80 columns.

[off topic]
OK, I take that back. Three days ago my 2nd PC's CRT died so I plugged
this old B&W (composite video) into the S-Video out (with a homebrew
adapter for luminence) of my video card. So I guess I am using it in 80
columns, now. LOL!   It's sharp but this is like looking at 8 pt type.
 I still can't imagine using 5.5" display but thanks for the
information on where to get one.

I too am curious about what you are using to connect your Atari to a
19" LCD.

I'm using an outboard TV tuner (obsolete Viewsonic VB50HRTV) with my
19" CRT. This turner has RF, composite, and S-Video (my 800XL feeds
this) but only VGA output. I haven't seen anything similar with a DVI
output so I was just wondering how you are connecting the LCD.

I JUST ended up buying a PlayStation->USB adapter for my Linux box
(for both the DDR dance pad, for which I'll try out PyDance, as well as
for simply playing with PlayStation joypad controllers).

Also, someone just emailed me this:

  http://www.kraftbrands.com/activegame/pad.aspx?e=email

I'd be interested to hear about getting USB working with the Atari joystick
port. (Or did you actually cut the lines inside the dance pad, to make
it act as an Atari joystick, rather than as a USB device???)

Just released new versions of MyIDE Config, MyIDE Image Manager and a new
program called MyIDE Image Batcher that lets you copy multiple ATR disk
images to image space in one batch process.

These versions only work with the newer 3.5F and 4.x versions of the MyIDE
OS.

Check them out here:
http://www.jeffersonsauctioneering.com/atari/

If you find the programs useful, let me know! If you have any suggestions
for features and enhancements or bug reports, send me a message!

I bought a gender bender, a DB 9 > 25 adaptor, and a null modem cable today.
I was trying to cut down on the massive wad of adaptors I use to connect the
modem Greg Goodwin loaned me to my 850. Thanks again, Greg! I hope to get a
UDS10 or MSS100 next month. :)

Anyways, if you happen to have one near you, I suggest you go to a Fry's

store. Be warned: every Fry's store I have ever been in is very neat and
organized, except when it comes to cables, adaptors, and occasionally
components... I dug thru a clusterfuck for over an hour before I found what
I was looking for, but it was there.

Why is it that everyone wants a 1200xl? I had one when they came out -
brought it at a bargain basement price since no one wanted it then due
to the incompatibilities with the 400/800/600xl/800xl?

On the other hand - I actually liked it alot. I would plug in the basic
cart from an 800 Ihad and never had a problem with incompatibilities.

Check the power supply (swap out for a known good one) and/or RAM (might
have to desolder.) Often you can just put your finger on all the RAM chips
in order and see if there is one that is much hotter than the rest... that
is likely the bad one.

After that, I would start checking the custom chips (ANTIC, GTIA, CPU).

And when "cbc" (he calls himself that) has found the faulty RAM chip, he
needs to
see a doctor. ;)

Hello folks,
ABBUC decided to do another software contest 2006. There is only one
change to the rules of 2005 - the deadline has been set to the 15th of
august (same deadline as hardware contest 2006)...

ABBUC
 Regeln f=FCr den ABBUC-Software-Wettbewerb 2006 =

 Rules for the ABBUC-Software-Contest 2006 =

 Pravidla pro ABBUC-Software-Contest 2006 =

 Zasady ABBUC-Software-Contest 2006 =

 Reglamento del concurso de software ABBUC 2006 =

Regeln f=FCr den ABBUC-Software-Wettbewerb 2006:
1) Allgemeine Regeln:

Der Abgabeschlu=DF f=FCr den Software-Wettbewerb wurde auf den 31. August=

2006 festgelegt.
Folgende Preise werden vom ABBUC vergeben: 1. Platz: 500 Euro
2. Platz: 250 Euro
3. Platz: 125 Euro
4. Platz: 75 Euro
5. Platz: 50 Euro
Der ABBUC erh=E4lt f=FCr die angemeldeten Programme das
Erstver=F6ffentlichungsrecht f=FCr das Magazin bzw. den Software-Wettbewe=
rb;
das Copyright bleibt jedoch weiterhin beim Autor, der sein Programm nach
dem Wettbewerb frei verwenden kann. Die Pr=E4sentation der Programme wird=

auf der Unconventional und im ABBUC Magazin stattfinden, die endg=FCltige=

Entscheidung und Preisvergabe hingegen auf der ABBUC-JHV in Herten im
Oktober. Der Autor mu=DF bei beiden Veranstaltungen (Pr=E4sentation,
Preisvergabe) nicht unbedingt anwesend sein, er erh=E4lt den Preis dann
trotzdem zugesandt oder =FCberwiesen, sofern dem ABBUC daf=FCr die
Postadresse und/oder Bankverbindung vorliegt...

2) Programm Typen und Gr=F6=DFe:

Bei den Wettbewerbs-Programmen darf es sich um folgende Programmtypen
handeln:
a) Spiel/e, b) Anwendung/en (auch Tools, Utilities, etc.) und c)
Betriebs-Systeme (DOS). Nicht erlaubt sind jegliche Formen von Demos
oder Intros, sowie Beta-, Vorab-, oder Pre-Versionen (die Programme
m=FCssen fertiggestellt sein). Bei der Kompatibilit=E4t ist zu beachten, =
da=DF
die Programme mind. auf einem XL oder XE Rechner laufen m=FCssen, d.h. au=
f
einem Standard 64k oder 128k Atari XL/XE. Es darf zwar Zusatzhardware
unterst=FCtzt werden, diese darf aber nicht die Voraussetzung zum Laden
oder Laufen des Programmes sein. Und ob man es nun glaubt oder nicht,
das ABBUC Software Ressort (und auch alle ABBUC Mitglieder) wird
(werden) einen =93Qualit=E4ts=94 und =93Kompatibilit=E4ts=94 Check aller
angemeldeten Wettbewerbs-Programme durchf=FChren...

3) Format und Sprachen:

Das Wettbewerbs-Programm kann auf 5,25=94 Atari-Disk(s) oder als
ATR-Image(s) eingereicht werden, es mu=DF als 90k (SD) oder 130k (ED)
Disk-Format bzw. ATR-Image vorliegen. Zu dem Programm mu=DF eine kurze
Anleitung vorliegen, diese kann entweder im Programm (intern) enthalten
sein oder als Text-Datei (extern) dazugef=FCgt werden. Wichtig ist
hierbei, da=DF entweder Deutsch oder Englisch verwendet wird (und kurz
erkl=E4rt wird wie das Programm zu laden ist), damit auch jeder das
Programm bedienen kann. Es sind =FCbrigens alle Atari 8Bit kompatiblen
Programmiersprachen erlaubt, jedoch am Ende nur Kompilate, damit jeder
das Programm laden kann. Ausnahmen sind lediglich Atari Basic und Turbo

Basic XL - hier sind auch Sources bzw. Listings erlaubt, da diese
Sprachen ja jeder Atarianer besitzt. Zu den Programmen bzw. Kompilaten
mu=DF keinerlei Sourcecode beiliegen, das fertige bzw. lauff=E4hige Progr=
amm
ist schon ausreichend...

Also dann, viel Spa=DF beim Programmieren - euer ABBUC Software Ressort.
(Charlie Chaplin / Andreas Magenheimer) Mail

Rules for the ABBUC-Software-Contest 2006:
1) General Rules:

The Deadline for the software-contest has been set to 31.August 2006
(until midnight).
ABBUC will therefore spend the following Prices: 1st Place: 500 Euro
2nd Place: 250 Euro
3rd Place: 125 Euro
4th Place: 75 Euro
5th Place: 50 Euro
For all registered contest programs, ABBUC will get the right of a
premiere-release on its magazine; the Copyright will still remain by the
author, who can use his program freely after the contest. The
presentation of the programs will take place at the Unconventional fair
in September and on the ABBUC magazines, whereas the decision and
pricing will take place at the annual ABBUC meeting in October. There is
no need for the author to be present at any of these events, the price
will still be send to the author=92s postal adress or his bank account,
provided that ABBUC has these adresses...

2) Program Types & Size:

The software-contest programs must be one of the following
program-types:
a) Game/s, b) Application/s (also Tools, Utilities, etc.) and c)
Operating Systems (DOS).
Not allowed are any kinds of demos or intros, also not allowed are any
beta- or pre-versions (meaning the contest programs must be finished).
For compatibility reasons one must make sure, that the programs work at
least on Atari XL or XE computers, which means standard 64k or 128k
machines. Additional or extra hardware can be supported, but it must not
be a requirement to own this extra hardware to load the program. Believe
it or not, the ABBUC Software Ressort, as well as all ABBUC members,
will do a =93Quality=94 and =93Compatibility=94 check of all registered c=
ontest
programs...

3) Format and Languages:

The software-contest programs can be send as 5,25=94 Atari disk(s) or as ATR-image(s), but they must use Single (90k) or Enhanced (130k) density. Furthermore, the program must have a short documentation, this can be included in the program (internally) or as a separate text-file (externally). It is therefore important, that one uses german or at least english language (and explains shortly how the program has to be loaded), so that everyone can handle the program. All Atari 8Bit compatible languages are allowed as programming languages, but all of them have to be compiled in the end, so that one can load the program without having to own a certain programming language. The only exceptions here are Atari Basic and Turbo Basic XL source listings, since every Atari user owns these languages. Lastly one needn=92t supply any source-codes for the contest programs, the finished loadable or executable program is enough...

Happy programming wishes the ABBUC Software Ressort !!

Zasady ABBUC-Software-Contest 2006:
1) Zasady generalne:

Ostateczny termin skladania prac do konkursu zostal ustalony na dzien 31 sierpnia 2006 (do p=F3lnocy). ABBUC zapewnia nastepujace nagrody:

1sze miejsce: 500 euro.

2gie miejsce: 250 euro.

3cie miejsce: 125 euro.

4te miejsce: 75 euro.

5te miejsce: 50 euro.

ABBUC bedzie mial prawo do publikacji program=F3w zgloszonych do konkursu=

w wydawanym przez siebie magazynie; prawa autorskie pozostaja wlasnoscia autor=F3w, kt=F3rzy moga dowolnie dysponowac swoim dzielem po zakonczeniu=

konkursu. Prezentacja prac bedzie miala miejsce na imprezie Unconventional we wrzesniu, oraz w magazynach ABBUCa, zas decyzje i rozdanie nagr=F3d beda mialy miejsce podczas dorocznego spotkania ABBUCa = w
pazdzierniku. Autorzy prac nie musza byc obecni na zadnej z tych imprez, nagroda bedzie

wyslana zwyciezcom poczta lub na konto bankowe, zakladajac, ze ABBUC bedzie posiadal te dane...

2) Typy i Rozmiary Program=F3w:

Programy zgloszone na konkurs musza nalezec do jednej z kategorii:

a) Gra, b) Aplikacja (r=F3wniez: Program Uzytkowy, Narzedziowy itp.) lub c) System Operacyjny (DOS). Wszelkiego rodzaju dema/intra nie sa dozwolone, nie sa dopuszczalne r=F3wniez wszelkiego rodzaju wersje pre- i=

beta

(program wystawiany do konkursu musi byc ukonczony). Dla zachowania kompatybilnosci program musi sie uruchamiac przynajmniej na komputerach Atari XL lub XE, co znaczy: na standardowych maszynach z 64 lub 128 KB pamieci. Rozszerzenia sprzetowe i sprzet dodatkowy moze byc obslugiwany, ale nie moze byc warunkiem uruchomienia programu. Wierzcie, lub nie,

ale ABBUC Software Ressort, jak r=F3wniez czlonkowie ABBUCa sprawdza "jakosc" oraz "kompatybilnosc" wszystkich zgloszonych prac...

3) Formaty i Jezyki:

Programy zglaszane na konkurs moga byc wysylane jako dyskietki 5,25" lub pliki ATR, ale dopuszczalne sa tylko gestosci pojedyncza i rozszerzona. Co wiecej, praca musi posiadac kr=F3tka dokumentacje, kt=F3ra moze byc umieszczona w samym programie, lub w dolaczonym pliku tekstowym. Ponadto istotne

jest uzycie jezyka niemieckiego (lub w ostatecznosci przynajmniej angielskiego), oraz kr=F3tkie objasnienie sposobu uruchamiania programu, zeby kazdy m=F3gl sobie poradzic z obsluga. Dopuszczone sa wszystkie kompatybilne z Atari jezyki programowania, ale produkt ostateczny musi byc skompilowany,

aby mozna bylo program uruchomic nie posiadajac tego jezyka programowania. Jedynym wyjatkiem sa programy napisane w Atari Basicu oraz Turbo Basicu XL, kt=F3re to posiada kazdy uzytkownik Atari. Dolaczenie kodu zr=F3dlowego programu nie jest wymagane, wersja skompilowana i uruchamialna jest wystarczajaca...

Reglamento del concurso de software ABBUC 2006
Reglas Generales: =

El plazo final de entrega es el 31 de agosto de 2006 a la medianoche.

ABBUC entregar=E1 los siguientes premios:

Primer Lugar: 500 euros.

Segundo Lugar: 250 euros.

Tercer Lugar: 125 euros.

Cuarto Lugar: 75 euros.

Quinto Lugar: 50 euros.

Para todos los programas concursantes, ABBUC tendr=E1 el derecho de publicarlo en su revista; los derechos seguir=E1n con el autor, quien podr=E1 usar su programa libremente despu=E9s del concurso.

La presentaci=F3n de los programas tendr=E1 lugar en la Feria No-Convencional de Septiembre y en las revistas ABBUC, donde la elecci=F3=
n
y premiaci=F3n se realizar=E1 en la reuni=F3n anual ABBUC de Octubre.

No hay necesidad que el autor est=E9 presente en alguno de dichos eventos=
,
ya que el premio puede ser enviado a la direcci=F3n postal del autor o
bien a su cuenta de banco, siempre y cuando ABBUC tenga los datos
correspondientes=85

Tipos de programa & tama=F1o: =

Los programas del concurso pueden ser de alguno de los siguientes tipos:

Juego/s, =

Aplicaci=F3n/es (como Herramientas, Utilitarios, etc.) y =

Sistemas Operativos (DOS) =

No se permite ning=FAn tipo de demos o intros, as=ED como ninguna versi=F3=
n
beta o preview (lo que significa que dichos programas ser=E1n
descalificados).

Por razones de compatibilidad, el autor debe asegurarse que su programa
funcionar=E1 en al menos en un computador Atari XL o XE, lo que significa=

m=E1quinas est=E1ndar de 64 =F3 128 kilobytes. Hardware adicional o extra=

puede ser utilizado, pero no debe ser un requerimiento poseer dicho
hardware extra para que el programa funcione. Cr=E9anlo o no, pero tanto
el organizador del evento como los miembros de ABBUC realizar=E1n pruebas=

de "Calidad" y "Compatibilidad" para todos los programas concursantes=85

Formato y lenguajes: =

Los programas concursantes pueden ser enviados ya sea en disco(s) de 5=BC=

como en imagen(es) ATR, pero deben usar densidad SIMPLE (90k) o
Aumentada (130k). Es m=E1s, el programa debe llevar una peque=F1a
documentaci=F3n, la cual puede ser incluida en el programa (internamente)=

o como una archivo de texto separado (externamente). Es importante que
dicho texto se encuentre en alem=E1n o al menos en ingl=E9s (y que expliq=
ue
brevemente c=F3mo el programa debe ser cargado), de manera que cualquiera=

pueda utilizar el programa.

Todo lenguaje de programaci=F3n compatible con Atari 8bit est=E1 permitid=
o,
pero todos deben ser finalmente compilados, de modo que se pueda cargar
el programa sin que se necesite poseer cierto lenguaje de programaci=F3n
en particular. Las =FAnicas excepciones aqu=ED son los listados programad=

os
en Atari Basic o Turbo Basic XL, dado que cualquier usuario Atari posee
dichos lenguajes.

Finalmente, no es necesario que nos env=EDen los c=F3digos fuente de los
programas en concurso, basta con se env=EDe el ejecutable final.

=A1Mucha suerte en su programaci=F3n! Les desea el equipo ABBUC.

(CharlieChaplin / Andreas Magenheimer)

I finallywon an auction for a SIO2PC last night.   What is the best
software?   I have a pc all ready to go, I basically just want to be
able to boot my 65xe from the SIO2PC and play some games (have a cd
with just about every piece of software ever made for the 8bit). Any
suggestions?

I suggest either Win APE or DOS APE, depending on which type of OS you want
to run. If you're not interested in the internet modem (like me), DOS with
APE on an old laptop works great! See Steven's site at www.atarimax.com
for ordering details.

I suggest APE also, probably the DOS one. It is 'crippleware', some
features are
disabled in the trial version. However, your stated desired use is fully
supported
in the trial version. If I recall, APE DOS allows all PC to A8 functions,
it just doesn't
allow copying from A8 to PC. There are other 'disabilities', all explained
in the
documentation. Yes, I suggest APE for DOS or Windows.

Then again, you could actually purchase it. :) I did, and it has been
worth every penny - plus Steven gives excellent support.

Andreas, I just want to say that it is great that somebody arranges
a programming contest for the classic Atari home computer.

And, of course, if you've got Linux in the house (like I do), and don't
Windows (like I don't), "atarisio" and "atariserver" are excellent!

Bob Woolley did that to one of his 1200XLs. CF card slot on the right,
cart/joystick ports on the left.

...and even if you are not a Linux guru (like I'm not) and don't like Linux yet (raise your hands) you can still use AtariSIO.

If you are are real nice Matthias Reichl may supply you with a floppy image which you can 1) produce a bootable floppy 2) Make an Eltorito bootable CD from the image or 3) do 1 or 2 and then copy the files to a DOS environment from which you can simply launch mini Linux, customized for AtariSIO or 4) use a utility like WinImage (I think that's the name) to extract the files directly from .IMG file to a FAT partition.

Yes, you have to boot DOS to launch mini Linux.

Anyway, I love AtariSIO and I'm still not a Linux user. (I keep
trying, honest I do).

800XL works but but 3.5 mods out of 5 don't.

1) Clear picture mod still has weird leading edge colors but picture is very sharp.

2) Internal SIO2PC works great. I love modular RJ11 cable, light weight, long lengths possible, and doesn't fall out (unlike those darn SIO connectors).

Finally bought off-the-shelf RJ11/DB-9 female adapters $1.89 each (something like that). Now I can plug the RJ11 cable into any of my PCs not just the one.

LOL spent about half an hour trying to figure out the pinouts I used. RJ11 is butt end to butt end. It's straight thru but pins 1-4 become 4-1 at the other end so remembering Send/Receive, ground, and Command line in the Atari connect to which solder joints on the RJ11 connector, connects to which pins inside the moudlar connector, maps to what pins at the other end, maps what RS232 pins. Well, that was all an ordeal. I never write things down.

I should have built a Max233 interface (like my external one). The 1-chip 14C89 SIO2PC works but I forgot it's not compatible with my ATR8000 (dumb mistake). Further I can't even connect the external Max233 interface and use that to talk to the ATR8000. Well, I don't use it much and I still have the 800.

I did find it amusing that I can use both the internal SIO2PC and the external one and talk two different PCs. Can't say I have a practical reason to do this.

3) I botched the Wizztronics 256K upgrade. I've got one of the 800XL models that requires two extra ICs for the Wizztronics. Problem was all the mounting holes on the Wizztronics board were filled with solder. I tried to remove it without the proper tools and did a poor job. Put the chips in anyway but they were only half in. Needless to say the board doesn't work.

4). Homebrew MyIDE still doesn't work yet. Originally it would properly detect only 1 drive out of the 4 spares I have but that drive had 20+ errors so I couldn't really use it. Mr Atari suggested I replace the 74HCT ICs with 74F types but now I have 33% errors on that

drive and MyIDE gets random data for Cylinder/Head/Sector information.
The old partitions (and new ones) are still there but I can't access
them.

Right now I'm wondering if a CompactFlash is more tolerant of the
timing problems.

4) Bob Woolley's SmartOS is going equally badly. I should never have
stuck with the original plan and not try to scale it down since I don't
read schematics very well as it is.

First I planned to piggback the SRAM over OS ROM but I was waiting for
a friend to burn some backup EPROMs for me. He was busy so I scaled
the project back to doing just the internal cartridge. I put a 28 pin
socket in the stock 24 pin socket and pulled A12 from elsewhere. (A12
on the stock socket sits where EPROMs/SRAM have CE/CS. Must have done
something wrong. 800XL jumped into memory test and the last 1/6th of
memory failed. I reworked the NAND gate ICs and simplified the project
even further by trying to just create the $D700 page of memory (It's
part of Bob Woolley's complete project). Unlike the -BASIC select line
which gets controlled by the OS (cart/no cart) the -$D700 is always
available. I thought it would make troubleshooting easier.

I finally got RAM to appear at $D700 but I must have the gates wrong.
When I write 256 bytes of information to that page about 5 bytes are
wrong. On successive reads the data starts to change.

Frankly, this is probably no project for a Noob like me but I'll keep
working at it.

At least I'm learning, though it seems the more I learn the more I
realize I don't understand what I'm really doing. LOL!

My 800XL is now a nest of wires

At least I haven't destroyed the 800XL. Yet!

- Steve Sheppard

>Yes, APE is the best bet! Really amazing program!

Im getting that impression. I have 2 old pc's which are perfect one
is a pentium desktop (with win95, cdrom, floppy) the other is an old
IBM thinkpad with only a floppy drive.   I want to eventually just use
the laptop because it is not noisy with fan and doesnt take up any
space, but since my main pc does not have a floppy I will need to
transfer software via cdrom to the desktop then use it to sneaker net
the software to the laptop.

Im thinking it is prob better to just use the dos version since it
will load so much faster?

APX (Atari Program Exchange) released a version of Pascal for the Atari,
however there were apparently some issues with it. This article I Googled
seems to spell out some of the issues with it. The high memory usage of the
runtime would almost certainly be an issue with a BBS program.

http://www.cyberroach.com/analog/an11/pascal.htm

The author mentioned "Turbo Pascal". The only Turbo Pascal I have ever
heard of was the wildly popular Borland Turbo Pascal developed originally
for CP/M, and then MS-DOS. It eventually evolved into Borland Delphi. It
certainly was never ported to the Atari.

If this could be ported to the Atari, perhaps Action!, C, or even BASIC XE
would be the best targets.

Three or four other 800xl's all work fine on that power supply so I don't
think that is it. All the chips in this machine are socketed, so I will
start with the RAM.

Thanks

There are:

Atari Pascal
Draper Pascal
Kyan Pascal
CLSN Pascal

The first three are readily located with XL Search,
http://www.newbreedsoftware.com/xlsearch/ .

I just noticed that, rather strangely, there seems to be no mention of CLSN
Pascal on the web at all! It was more recent than the others, a commercial
release that required a 128K XL/XE. Who owns a copy?

Anyone interested in a XEP-80 with original software Disk?

Its Clean and looks nice.

I have never used. But is suppose to be in very good working
condition.

If interested, send offers to me at:
phantomm@bellsouth.net

USA/Canada offers only please.

YES? I DO. It runs on XLIT on a Win98 machine using DOS 2.5. I have the documentation
at another location, but it is fairly intuitive, with sample programs on the distribution disk.
I don't know why it will run on XLIT, as I think XLIT is strictly 64K. What

I have at this location
is a .arc of a .dcm, and dcm->atr and run in XLIT. Should be in someone's
archive, It's not in
Holme's, or CTH. Maybe one of the Polish or Chezchk (sp) or German. Seems
like I'd be willing
to put it in someone's archive. Oh, there's the Vietnamese archive, but I
think that is mostly games.
I hardly used it, and don't remember any specifics/idiosynchracies.

     I would like to thank everyone who made the chat party last night such a
blast. We had Docrotcod, Davidb, myself, and Rick D on speakerphone here at
the Dallas area chatting away with our computers setup (An Atari XE, 800, and a
Mac lap with Atari fonts at least)

    In the chat room we were welcomed by Slor, eventually followed Cybernoid,
Mojo, and Dan.   Chatted till about 3 in the morning. :)

    Thanks for the most fun we've had in a while. We've have to meet like that
we think sometime in March.   Sounds good to me. :)

    As I was telling Docrot last night at the party, Atari Age has restarted
their gaming contests for another year. The first game was Zybex, the second
game, JOUST!

http://www.atariage.com/forums/index.php?showforum=60

While there are no details posted yet on how they are conducting the Joust contest, I sure before this weekend is over they will post it. If you haven't joined these contests, now is a great reason to start because...

1) This is a brand new year
2) Games played in contests two years ago tended to soak up the all time favs like Joust, which are now available to be voted on, thus meaning more familiar titles to play.
3) I have had a lot of fun learning about other games aside from my Star Raiders, Archon, Wizard of Wor and Joust that I have played for umm... decades. :) (and I once swept a contest on a game I had never played before. So you never know.)

(If you have any questions, or need help finding a game image, let me know.)

So for now... let the JOUST begin!! (lowers visor on helm.)

I searched the vendor's list, B&G (myatari),
Video61 (atarisales), Ben Smith (google it),
Best doesn't give an online catalog. ie.
if someone has it for sale, that'd be the way
to go for the (???? who wants it?)

Hi Kevin-
> I want to eventually just use
the laptop because it is not noisy with fan and doesnt take up any
space, but since my main pc does not have a floppy I will need to
transfer software via cdrom to the desktop then use it to sneaker net
the software to the laptop.

Im thinking it is prob better to just use the dos version since it
will load so much faster? <

If I understand you correctly, you want to use a laptop that has no
hard drive as your vehicle/server for your Atari via the SIO2PC cable?
And you want to use the ATR image software on CD-Rom on your Atari. If
this is correct, then no HD will certainly limit your options. APE for
Dos is very functional, but can't compare to the ease of use of the APE
for Windows interface. Fortunately, trial versions of both are
available, so you can try before you buy and see how things work out.
Good luck. -Larry

Ive been sick all week with a fever, so maybe I came across a bit
confusing!   You see I have 3 computers.   One I am using now which is
a new modern pc.   In the other room where I am going to set up up the
65xe/sio I have 2 old pc's one is a desktop (circa '96) with
win95/HD/CD/Floppy and the other is a really old thinkpad laptop a
relative gave me instead of throwing it away.

I want to use the Laptop with the Atari, but in order to get software
to it (since my modern pc down not use a floppy) I need to copy the
8bit stuff to the old pc and then slowly use the floppy drive to copy
over stuff to the laptop.

....

My main reason for using the dos version is it will load faster (takes
forever to load windows) is there some great advantage to using the
Windows version of APE?

Here's the setup I have:

1200XL with APE Warp+ OS
1050 with newest Happy Enchancement

My question is - is the high-speed mode of the Happy upgrade compatible
with any normal DOS like MyDOS, SpartaDOS, or some modifed DOS 2.5? The
Warp DOS that comes with the upgrade is pretty limited...

Alternatively, is there a way to make Happy upgrade compatible with US
doubler?

Thanks!

MrScout

There is an OS patch that will load the Happy Warp Speed drivers into the OS. I believe this is on side B of the Happy diskette. You just set it as your autorun.ar0 or autorun.sys file and Happy drives will work at high speed after that.

On the Happy utility menu of the Warp Speed software disk, there is an option to enable US Doubler emulation. That will change the drive to US Doubler mode until you power cycle the drive.

I am pretty amazed at the MyIDE idea, the continuing developments in
Atari mods continues to surprise me. Does anyone know of plans to
enable a hard disk to be attached via the serial port SIO2PC-style,
rather than through the cartridge contacts? It would be great to be
able to attach a drive directly without going through a PC or the
cartridge slot.

you would need a intelligent controller to comm with the
8bit/harddrive. I would think it would be too much work/expense to do
this.

a few questions dely (since I cant make head or tails out of that
website) This costs how much? ~30$ translates into what American
dollars?   Also how does this work? is there an external version that
doesnt require any soldering? Am I right in assuming you are
formatting the HD on the pc and then removing it and installing it in
the XE?   Finally how does this compare speedwise with a Harddrive
attached thru ECI port?

Thanks

Assembled unit costs about 100PLN (Polish Zloty), 1 USD (US Dollar) =
3.15 PLN.

> Also how does this work?

It is emulating up to 9 Atari drives (D1: to D9:) via ATR files located
at FAT formatted HDD.

> is there an external version that
> doesnt require any soldering?

Yes, you can plug it into SIO hole ;)

> Am I right in assuming you are
> formatting the HD on the pc and then removing it and installing it in
> the XE?

Yes. It is also equipped with USB for easy uploading ATR's without
removing HDD.

> Finally how does this compare speedwise with a Harddrive
> attached thru ECI port?

Poor, max is Ultraspeed (56000 bod).

Is the .ar0 file extension something that DOS 2.5 recognizes?

Project Badsector.

I started this project in 2000 and wrote what would now be called a blog.
I wanted to interface an IDE HDD using the SIO so that it would work with my old Atari 800. I built a prototype and got it working. The web pages are well out of date as I have now had a PCB manufactured. The project stalled when it came to the Atari DOS software part of the project. It can currently emulate a floppy drive which shows that all the hardware is working.

For more information including schematics and source code goto:-

http://www.alma.demon.co.uk/Atari/AtariHwSw.html

I've also worked on other projects based on the same hardware, such as interfacing a ISA ethernet card to the same project. In theory this would allow the Atari to speak via the SIO to ethernet, although I'm not sure what use this is.

If I get time I ought to update the web pages and add some more pictures.

regards...

It seems the discussion on Atariage is about
development on the ST/TT/Falcon, not the
8-bit. Which system are you talking about?

However, the driver may or may not work with dos 2.x, but you can give it a
try if you just name the file autorun.sys

The main problem with this concept is the data rate. The SIO port is
serial, while the MyIDE basically goes through the PBI/ECI interface. While
you MIGHT be able to accomplish hooking a IDE hard drive via the SIO port,
it would defeat the purpose as it would be way too slow to transfer data of
any respectable size.

I don't know about that. From what I've heard, the SIO2IDE project is
pretty good. After all, a large part of a person's hard drive activities,
even on a MyIDE is loading basic disk images (games, demos, etc...) and
these were meant to load from floppy anyway, and thus through SIO.

The nice thing (AFAIK) about the SIO2IDE hardware is that you don't need
special drivers or OS patches.

Still, I don't have one, and have two MyIDE interface and have written
three (and a half) programs for the MyIDE interface.

On that topic, I'm batting around the idea of creating a simple sector
editor for the MyIDE hardware. Anyone interested in a program that can
look into and edit the raw hard drive sector data on a MyIDE setup?

Hi,

A preview of a new tool to access a FAT32 Filesystem on USB Storage can be
downloaded at Sourceforge:
http://sourceforge.net/project/showfiles.php?group_id=111428&package_id=175280

Sourcecode and short Command Summary USBDOS Program is available in the
MicroUSB Wiki:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartUsbDos

The current version is not really useful for Users. It is more a preview
what will be available in the next weeks.

This tool will be expanded in the
next weeks and will hopfully evolve in a full DOS for USB FAT32 Devices.
It will be possible to copy File from USB Device to the Atari and back in
the next versions. This version can be used to explor the Device and to
list the Root Directory on an USB Storage.

Best regards

Carsten Strotmann

I should have mentioned, I used it in the Carribean, tropical
climate...perhaps heat might have been an issue?

               Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Sorry if this appears twice, google groups seems to be playing up at
the moment.

Does anyone in the group have a non-functioning 1050 drive, I have one
that needs a replacement PCB so if anyone has a carcass sitting around
with intact circuitry I'm interested. Even just the circuit board would

do. I'm in the UK but even if you are overseas let me know how much you would be looking for.

Thanks again to everyone in this group, and a belated happy new year to you all!

I don't get it. Sour grapes would be if you lose something and won't admit that its your fault. I didn't work at Commodore either before they lost the plot or after ... why would noticing that they lost the

plot be sour grapes?

I have a large collection of classic units, and large collection of game carts for each one. I would like to box up alot of my carts and put them in storage to make some room around here. I was wondering if there are any solutions for these systems or better ones than I have found so far.

Commodore 64: Somebody recomended a Retro Replay, does this hold alot of rom images? If not, I'll have to research in running them off the floppy drive.

Vic-20: Found nothing so far, but would it work to have a 24k ram board and run carts off the disk drive?

Atari 8bit: I have a Flash Max!!

Atari 7800: Cuttle Cart2

Coleco: I know there was a multi cart, but Telegames shut it down. A flash cart would be nice but haven't found one. I could possibly run

carts off the floppy on the Adam I guess. I would love to see a cuttle cart2 type thing for it.

Oddyssey2: I found a 128-in-1 cart!

Intellivision: All I found so far is a Supercharger type device which isn't made anymore. I want to play the ECS games on the real thing!! I would love to see a cuttle cart2 type device for it.

Fairchild Channel F: I think I am out of luck here LOL

HI,
  Well, I have alot of game machines/classic computers and alot of carts for each of them, and when I play it is a pain. You know what I am talking about. I am looking for a way to fit as many into one cart as possible, so I can box up alot of my carts and put them in a safe place. I know of some that exist, but are there more, or maybe better solutions ?

Systems I am looking for:

Intellivision: Well, I know there is a thing like the Atari
Supercharger exists, but now out of production I would love to play ECS
games on the real deal :(

Colecovision/Adam: I found one, but Telegames pulled the plug on this
multi-cart. I may just have to find a way to back them up on disk.

Atari 7800: Cuttle cart is the way to go. I wish these were on all
systems :)

Atari 8-bit: FlashMax looks great

Commodore 64/128: So far disk looks like my best option. Somebody has
suggested Retro-Replay. Would that work?

Oddyssey2: 128-in-one looks like the best option

Vic-20: Well, I wonder loading from disk onto 24k card would do the
trick

Farichild Channel F: I think I am out of luck here

heat might have been an issue?

If the power supply was anywhere NEAR as bad as Grenada's in the
1980's, it could be a combination of heat and bad power supply from the
grid. Luckily I had a C128 when I was in Greneda, and it had a much
more robust power supply than the C64.

I have a large collection of classic units, and large collection of

game carts for each one. I would like to box up alot of my carts and put them in storage to make some room around here. I was wondering if there are any solutions for these systems or better ones than I have found so far.

Commodore 64: Somebody recomended a Retro Replay, does this hold alot of rom images? If not, I'll have to research in running them off the floppy drive.

Vic-20: Found nothing so far, but would it work to have a 24k ram board and run carts off the disk drive?

Atari 8bit: I have a Flash Max!!

Atari 7800: Cuttle Cart2

Coleco: I know there was a multi cart, but Telegames shut it down. A flash cart would be nice but haven't found one. I could possibly run carts off the floppy on the Adam I guess. I would love to see a cuttle cart2 type thing for it.

Oddyssey2: I found a 128-in-1 cart!

Intellivision: All I found so far is a Supercharger type device which isn't made anymore. I want to play the ECS games on the real thing!! I would love to see a cuttle cart2 type device for it.

Fairchild Channel F: I think I am out of luck here LOL

HI,
  Well, I have alot of game machines/classic computers and alot of carts for each of them, and when I play it is a pain. You know what I am talking about. I am looking for a way to fit as many into one cart as possible, so I can box up alot of my carts and put them in a safe place. I know of some that exist, but are there more, or maybe better solutions ?

Systems I am looking for:

Intellivision: Well, I know there is a thing like the Atari Supercharger exists, but now out of production I would love to play ECS games on the real deal :(

Colecovision/Adam: I found one, but Telegames pulled the plug on this multi-cart. I may just have to find a way to back them up on disk.

Atari 7800: Cuttle cart is the way to go. I wish these were on all systems :)

Atari 8-bit: FlashMax looks great

Commodore 64/128: So far disk looks like my best option. Somebody has suggested Retro-Replay. Would that work?

Oddyssey2: 128-in-one looks like the best option

Vic-20: Well, I wonder loading from disk onto 24k card would do the trick

Humidity may have been, heat dunno, it gets plenty hot here in summer.

Humid?

Not really compared to the tropics it's pretty dry.

(I'm in Perth too btw)

I have an excess Magnavox Computer Monitor 80 available to anyone who is
willing to pay shipping for it.

This is a composite green screen monitor. Unlike some versions, this one
has no sound input or speaker but has a very clear picture, and a clean
non-yellowed case.

Note: Although I get a great picture in Atari graphics modes and from an
Apple II in both 40 and 80 columns, it doesn't seem to want to sync when
attached to my XEP-80. This also happens with my other Magnavox Computer
Monitor 80, so I don't know if the problem is my XEP-80 or just that these
monitors are incompatible with it.

Anyways, the first person who claims it and is willing to pay actual
shipping costs gets it. Email me at jharmonNO@SPAMus.net (obviously
removing NO SPAM from the email address).

Some threads posted recently in this newsgroup, and the comp.sys.cbm newsgroup, made me want to check a couple of games for the Atari and compare screenshots with the Commodore 64 counterparts.

I happened to find an interesting record in wikipedia.org, about the game in general, but also with a comment on the difference between the Atari and Commodore versions.

http://en.wikipedia.org/wiki/Koronis_Rift

I am a bit surprised to read the third sentence in the first paragraph. It must be a misunderstanding, that the Commodore version utilises colour better, to fade in graphics.

I should note that this is a US model NTSC monitor, and that it will be
shipped from Maryland in US.

It is fairly light and shouldn't cost too much to ship.

I've put together a black t-shirt and mouse pad at CafePress sporting
the Star Raiders heads-up-display with a big "WHAT'S WRONG?" in the
corner. :^)

For folks who feel like wasting $20+ bucks on such a shirt
(some change is thrown my direction ;^)), see:

  http://www.cafepress.com/xlfan

I hope to add some other Atari 8-bit related stuff, like a t-shirt
with a big READY prompt, at the least. ;^)

I remember returning to the island after years, when I got out the plane the
humidity hit me as if I had just walked into a bathroom that someone just
took a shower in. When I reached home, pretty late, downstairs was all
locked up and as I was having dinner, I was drowning. The pepper sauce
didn't help either.

 :)

Not according to the BBC Weather Bureau. They have the humidity below 60 percent for November to March, and it only gets to 76 in winter AM. Where I was born "humid" means closer to 100 percent than to 50 percent. Those are called "the dog days of August".   That's the kind of humidity I felt in Grenada, but being on the Windward side of the island meant that it was OK if you were on a shaded patio on the sea breeze side. The BBC weather bureau has Kingston Jamaica (one of the few Caribbean cities it lists) as being close to that, with AM humidity ranging from 77 to 88 percent, and PM humidity ranging from 61 to 73.

Of course that's its not as bad as Houston ... AM humidity in the high
eighties 12 months of the year. In the summer time its like living in
boiling water.

Does anyone know if there was a version of LORD for Atari BBSs? If so,
where can I download or buy it? Thanks!

Argh, of course I meant, "Legend Of The Red Dragon". :-(

Great job here. Can't wait to try out the final version.

SNIP
Also, as a side note Draco has a program called mksdfs.com that is similiar to SpartaDOS format program and will set up a SDX file system on any partition. The following text is his readme for the program. Just recently got this one and have not tried it on the MyIDE interface yet.

MKSDFS - MaKe Sparta FileSystem

The program initializes floppy
disks and hard drive partitions
with fresh structure of Sparta
DOS filesystem.

This action has similar effect
as formatting: all files get
lost. However, no physical (hard)
formatting takes place.

In other words, the program
does less or more the same thing
as does the SpartaDOS X's FORMAT
command, when you select the
"Build directory" option.

I wrote this, however, because
I wasn't able to find any sensible
replacement working with
SpartaDOS 3.x. Also the primary
purpose of this program is to
initialize hard drive paritions
but it should work with any other
disk-type device.

Options:

-t is 'test mode', the program
does all the things it does normally
but it does not alter the filesystem.

-o is 'optimize filesystem' - the
last sector of the disk, normally

always marked used, is recovered.
Expect complaints from CleanUp,
however.

Have fun,
draco AT atari.org

Using fdisk.bas from MyIDE and make your partitions and try this program.
Using the swap partition function of MyIDE software.

And if you install the Video Associate Labs VB3 Microkeyer in your
Apple II or Apple II+, you get some added video modes including linear
mapping.

Wish I still had mine. Sigh.

That's a pretty amazing mod, since video generation is so
pervasive in the Apple II design.

How did it do that?

-michael

The VB3 consisted of two boards. One was a rather long slot card, and
one was a big rectangular card that sat over the power supply. The
two were connected by a ribbon cable. You pulled out about a dozen
of the TTL chips in the Apple, and installed small ribbon jumpers between
them and the VB3 boards. The slot card was mostly digital, and the
card that sat over the power supply was mostly analog.

The main purpose of the VB3 was to act as a gen lock and proc amp, make
the video fully compliant with the NTSC spec (and thus FCC broadcast
requirements) and do simple video overlay and keying. The linear mapped
hires graphics mode was a bonus; since they replaced the entire video
timing chain anyhow, it was relatively easy to add.

Schematics weren't available, and I wasn't inclined to try to reverse-
engineer it. I suspect that the most amazing part of the design was
getting the color phase correct. One of the most serious deviations of
the Apple II video from NTSC spec was that it used 228 cycles of the

color carrier per scan line, rather than 227.5. Woz did that so that
the color phase would be the same on all lines. But that doesn't work
if you're generating true NTSC.

Eric

I don't wanna subscribe to them, now do I? I wanna read and post here.
Unfortunately, my ridiculous newsgroup company doesn't allow posting to a
newsgroup until I specifically email them and request it, then I gotta test
it.

So, once again. Please ignore.

Thanks for the explanation.

Now that I know it's a genlock card, I understand both the motivation
and the niche market support for such a complex modification.

In 1979-1980, I lived in Austin, TX, and the local TV station used
a Apple equipped with a genlock card for the weather forecast graphics.
Sounds like it might have been this system. ;-)

Compare the CoCo 3, too. It's not that different from the Atari.

> I am a bit surprised to read the third sentence in the first
> paragraph. It must be a misunderstanding, that the Commodore

I would think the C= version would be the worst because of it's
character cell problem. Atari has the most colors, so it should be the
best.

As a partial answer...Long before there were video displays, computers printed to
electric
typewriters...teletypes. A set of codes were developed to control the machines

and send
text, numbers, and punctuation. ASCII codes.

Codes 0-31 were machine control codes...still are.
32 is space, 33 and up is numbers, punctuation, uppercase and lower case.

Once you start working with video screens, in order to clear the screen which is a better
value to poke into each location..0 to 32? 0 of course, so the ascii codes table got
rearranged...and atascii was born...with the original 0-31 codes being augmented with
displayable graphics characters, and values about 126 being inverse video.

And yes, some codes were changed to reflect their function on screen...155 being a cr+lf.

Keyboard codes are a special case related to the keyboard hardware matrix itself..it gets
converted from a table in rom. On the XL/XE, you can create a soft table and make a dvorak
keyboard.

I assume all computer manufacturers made changes to the codes to suit their needs.

Has anyone attempted to replace the internal XL/XE BASIC IC with BASIC XL or other SuperCart? It would require the support chip(s) to bank properly, so it would require a small adapter board. IIRC, this was to be part of one of the FTE upgrades -- "Mars 8" or something similar to that. -Larry

    I'm sure this is nothing new, but wanted to share what i've done with my
130XE.

Basically all I did was install the internal MyIDE. But instead of using
the standard 2.5" Notebook HD I installed a IDE/CF adapter. I hot glued it
down on top of the PIA chip. Pulled power from the capacitor between the
CPU and SIO port. The thing works like a champ! I highly recommend this as
a solution for anyone wanting to use the MyIDE.

One other thing: In the internal MyIDE specs it says to use the 1.5Amp
power supply in order to power the hard drive. Using this CF adapter the
power draw is low enough it seems the 1.0Amp power supply is doing just
fine.

    Well, short notice, my apologies, I have been a bit tied up.

But if you are in Dallas and would like to make it to a mainly Atari 8-bit party, drop me an E-mail at goodwing (at) aafes (dot) com. I'll E-mail back directions and a way to contact me. Leave me a number in the united states, and I will call you after 9 pm tonight or even tomorrow.
If you can't make it, we will call you from the party.

You can also party in the Atari chat room at telnet://www.atarinews.org. Chat room starts at 7 pm CST, party in Dallas (with Pizza served on a floppy) :) will start at 8 pm cst.

Bring your 8-bit and a way to connect to the ethernet (and maybe a ethernet cable) and we'll let you jack in and talk in the chat room. So everyone in the world will be able to party tomorrow night. It's just that I'm spotting for the pizza for those that attend. :)

See ya'll tomorrow,

Doc Clu

One of my 800XL's is messed up. When I turn it on I get an orange screen (that sometimes changes to yellow). No boot noises... no hesitation just Power ON -> Orange.

Anyone ever seen this or have any ideas what it might be?

>Pascal or Turbo Pascal for the Atari 8-bits?

From what I remember of Pascal, it's fairly similiar to C, isn't it?
Perhaps it could be ported to C fairly easily?

There exists a good cross C compiler for the 8-bit at http://www.cc65.org/

There was someone who posted a picture of thiers, where they have the CF
accessible from the side of the case (a slot was cut in the case to allow
access just above the joystick ports.)

Check out http://www.atarimax.com/flashcart/forum/ for news about the
latest developments for MyIDE.

Personally, I'm doing all development on the 3.5F and 4.x versions.

My CF card and adapter is coming! Just ordered one off eBay.

Unless something's changed recently, 16MB has always been the largest
formatted partition possible.

Hi,
I have done this but it gives headache's.

With DiskRX modify the Boot Sector byte offsets for length of partition.
Then run Cleanup (sp) the SDX program that cleans directory errors. VTOC ..
Reboot and delete all files except 33a.dos. After a couple of months and a
lot of copy file problems. I went back to 16 meg partitions. Then later I
heard that MyIDE has a copy bug problem across partitions. But I never went
back to smaller partitions. I do most of my work with MyDos and only use
the 33a partitions when doing SpartaDOS programs.

RoyE

So get out of here :) and BTW C64 sucks :P
Best example how to f..k-up a home computer with
great possibilities. Look at C64 OS and the computer
itself (design) makes me want to throw up :),
altough hardware is good (except ports, which
will burn by smallest electrostatic shock).

You are totally right and fair.

The Atari 800XL suffers from the same problems that modern PC's suffer from:
backwards compatibility. Like every PC has to be backwards compatible with
the original IBM AT (and even the XT), the Atari 800XL had to be backwards
compatible with the Atari 800 and Atari 400. This is a brake on any new
technology. Never trust anything that has the word 'backwards' in it.

And it was badly done too, because they hardly added any new stuff when
going from the Atari 400/800 to the 600XL/800XL. It was mostly integration
of the chips to get the costs down.

But anyway, you could have kept you post a lot shorter. The argument of the
8 sprites is enough to make the C64 come out on top.

And the argument of the C64's BASIC is only partly true. Stick in a Simon's
Basic cartridge, and the machine destroys any Basic ever run on any Atari.
You can also load Simon's Basic from tape or floppy.

PeterV

No, not really. If speaking the truth is regarded as trolling these days,
then something must have gone horribly wrong.

Read the magazines of the 80's. I don't think Commodorus thought up even 1
of his arguments himself. They can all be found in articles of the 80's.

Actually, Commodorus is kicking an open door.

While I could really care less about which system is better, I do have a question here aimed at anyone with decent familiarity with both systems, which I will get to in a minute.

I used several different C64s a lot in school back in the day, and one C128. I was very young at the time, so I never really did much with them, but my school let me do whatever I wanted on them so long as I didn't screw with their disks (I remember playing around with "Logo Robot" for HOURS! Is there a version of this available for the Atari, or was it strictly a C64 thing?).

My introduction to computers was with an Atari 800 my dad had bought sometime in '80, so it was the machine I monkied around with more than anything. I learned BASIC & Assembly on it and never got too deep into C64. These days, I still have my Dad's old 800, and the 130XE he bought later on. Of the 2, I use the 130XE all the time.

I picked up a C128 in a garage sale a while back for almost nothing, and, to be perfectly honest, about the only thing I remembered how to do with it was kick it into C64 mode. Had my dad owned a Commodore machine instead of an Atari, I would probably be a Commodore user/collector. The C128 is still sitting in the closet gathering dust. Hasn't even been turned on since I bought it.

Anyways, I don't know much about all the different BASICs available for the C64 (a quick google search led me to a page with a SHITLOAD of different ones. wow.).

On to the question: So Simon's BASIC is supposedly fast as hell, eh? How does it compare to Turbo BASIC XL (my favorite flavor on the Atari)? Each have their respective compilers.

Now, just so nobody gets the wrong idea, I'm not trying to discredit either machine or Peter. I'm just asking a question.

The reason that so many BASICs were released is that the built-in BASIC
sucked. (Yes, I'm a 100% C64 guy, but it's simply fact that CBM BASIC V2 is
underpowered for the hardware and the disk drive speed is crippled.
Everything else is automatically better than any non-C64 machine, though.
;)) So there was a supposed market for BASIC upgrades, but most decent
programmers went straight to assembly instead of trying to boost the BASIC
capabilities. BASIC had basically become regarded as for beginners and
lamers, though it had some limited success in business/serious applications.
In regards to your question, I don't think you're going to get much response
about the various performance measures of upgraded C= BASICs because the
most people who would care about such performance didn't use them. :)

Wel, ehhh, one thing I remember about Simon's BASIC was that it WASN'T fast
:).

I once wrote a line-drawing routine that was faster than Simon BASIC's. I
don't know why, I was just trying to make my own line-drawing routine in
assembly.

If you changed SIDs every two weeks you were probably typing by slamming
your forehead against the keyboard.

The hardware does it as standard in character mode; if the upper bit of the
colour nybble is set, the graphics are in 160x200 multicolour and if it's
not set they're in 320x200 hi-res and that mixing can happen on a per
character basis so it's far more flexible than a vertical split.
Essentially, the C64 is always "thinking" at 320x200 resolution regardless
of the mode, the horizontal smooth scroll and horizontal sprite positions
are always working at that res even when in multicolour graphics or sprite mode.

Mid-scanline changes can be done between multicolour and hi-res bitmap, i
did it in my demo Lethargy in 1993 (hi-res bitmap logo on the left with a
$D016 wave effect, multicolour bitmap with interlace on the right) and
there's a better example by Crest in Ice Cream Castle if memory serves.

Sure, but not bad for coming out _3 years_ earlier. :^) Computing
technology moves pretty fast.

> C64 wins

I don't think anyone was arguing whether the C=64 had better sprites. :)

> The ATARI has 256 colors - but where? All the colors look the same and admit
> it, the ATARI doesn't even have a decent red. The colors of the ATARI 8 Bits

I'm not sure how a 'color' can be 'blurry'. Maybe you've never seen an
Atari connected to a decent display using an Svideo cable...?

> In HiRes, the A8 can only use 2 colors.The C64 can use all 16. The
> A8 can use artifacting, but the colors look like old PC CGA

I thought that PAL simply got slightly different colors.

<snip>
> ATARI's 256 color mode - ridiculous, the resolution is only 80*96 and these

80x192, actually.

> Sound :
> Not much to say.

Agreed. Though when listening to streaming chiptunes (e.g., Kohina),
I'm often pleased to see "Atari XL" music composed by "X-Ray" which sounds
about as good as some of the best C=64 stuff I hear on that station! >:^)

ducks for cover

<snip>

> on the old 48K machines with the old OS.

I'm not sure how that's a bad thing. Do C=128-specific programs run
on C=64s?

> They didn't really improve th XL/XE machines. No better
> graphics, still the same 1-colored 4 players and 4 missiles

Well, we all know that Atari had really lame priorities ever since...
well... when did Bushnell leave? :)

<snip>
> The C64 did never have this compatibility issues. Programs worked
> on every C64.

Regarding DOSes, it's not hard to simply boot another DOS on the Atari,
since they're on disk. No ROM chips to swap out. :)

> And the C64 didn't have such a lame DOS. It has its disk operating
> system and it works.You don't have to search for the correct DOS,
> you have only one density and everything works on every C64.

I'm _very_ glad I have MyDOS, and do not have to deal with C=64's "DOS"
from 1982. ;^)

> And don't let us talk about cassette recorders. The ATARI
> cassette recorders are slow.Very slow. They can play music

People still use cassettes? :) Oh wait, you're talking about back
when the C=64 came out.

People still used cassettes in 1983!? :)

<snip>
> BUT, it forced us to learn POKEs and learning POKEs is
> the first step to learn Assembler, machine language.

I went straight from Atari BASIC to Action!, and then into C.
Thanks to Atari, Action! and C courses in college, I'm now employed
full-time as a video game developer.

I'm not sure how much 6502 experience would help. I haven't done _one lick_
of assembly in the years I've worked hear. It's practically shunned upon.
(These are phones with 100x the computing power of the Atari or C=64,
with threaded OSes and such!)

<snip>
> Many ATARI users keep telling us that the ATARI had
> "incredibly" strong games in the early 80s such as

> the early 80s.
>
> After 1985,

After 85, I wouldn't even really be thinking about the C=64 any more,
either. I would have moved on to the Amiga. ;^)

<snip>
> The C64 totally beats the ATARI machines. The ATARI
> machines are absolutely inferior and they can only
> be compared with systems like the VC20 or the Apple II.

You seemed to focus a lot on games. Of course, we all know that
IBM PC and Apple killed the Atari and Commodore both, simply because
so many more people wanted to do _non_game_ tasks.

<snip>
> This is the reason, the C64 dominated the 80s and the
> 8 Bit era. It was cheap, powerful and easy to
> understand while the ATARI was old-fashioned,
> weak and far too complicated.

Don't tell that to me when I try to sit down and load a game on a C=64.
Sure, the Penny Arcade theme song is catchy, but my friends and I
had to ask the artist what the hell "L shift O to the quote and then dollah"
actually _meant_.

Jeez... anyone at Commodore ever hear of typing "DIR" [return] to get
a disk directory!?!? :)

exactly.

At least Atari hardware is interesting, unlike that unimaginative spectrum

junk.

The Atari 8-bit and the C64 had a lot of custom hardware in them. The Apple
II and the PC were built from parts-bin stuff. I played some Apple games on
a emulator out of curiosity, and I was not impressed with them, particularly

after playing the same games on the C64. The Apple's graphics were not much
better then CGA graphics. Nor was the sound anything worth noting. Remember
that the Apple used a mono-channel beeper just like the PC did. The
difference was that on a PC, the timer chip controlled the speaker. On the
Apple, the CPU controlled the speaker, so you couldn't have much of any
sound in games as it would slow down the whole computer.

> that is true, and yet there are some great games for Apple II series.

There were some good games for the CGA PCs, as well. Digger, Alley Cat, and
Shamus were some examples of well-done games on the PC.

This is what I think, based on remembering talking to many people who
were deciding what to get back then:

They NEEDED to get the cost down! Trouble is they never got it down
far enough fast enough to compete with the C64. The 800 was trying to
compete with the Apple2, but it couldn't due in large part to Apple's
wise maneuver of getting education all outfitted in Apple. By the
time Atari tried (and failed) to compete with the C64 price point, the
momentum was already in the C64 favor. I still remember Atari 800XLs
at $320 with C64s at like $200-250. It is my belief that the
technical merits of the machines was less a factor than price point.
I think the great unwashed masses, rightly or wrongly, saw them as
rough equivalent commodities and came down on the side of price. And
the C64 was cheaper.

>But anyway, you could have kept you post a lot shorter. The argument of the
>8 sprites is enough to make the C64 come out on top.

The 8 sprites is definitely the superior of the Atari, but for me, not
enough to put it on top.

>And the argument of the C64's BASIC is only partly true. Stick in a Simon's
>Basic cartridge, and the machine destroys any Basic ever run on any Atari.
>You can also load Simon's Basic from tape or floppy.

No, it doesn't. Atari8 wins the BASIC battle IMHO. BASIC XL/XE,
Turbo BASIC (and the compiler! yeah!) are the better.   Simon's BASIC
was pretty darn good though, and light years ahead of the built in
BASIC. Also on a stock alone basis, Atari's BASIC was much better
than the C64 built in.

I might also add, that Atari wins in the OS/DOS department as well.
SpartaDOS (especially X) was way ahead, and stock for stock or modded
for modded, Atari's floppy drives were faster too.

I think both the C64 and Atari8 were/are fine machines and I have a
similar respect for both. And I'm not just saying that to try and
compromise.

Commodore had for more quality issues than Atari. Not that Atari was
saintly mind you (especially once the XEs came out). No one with a
shred of honesty even pretends to debate this.

Hi Bill!

Good descriptions all around. On the monitors I've owned (an old
Magnavox, long gone, and a Commodore 1702, still around) APAC mode
worked quite beautifully. On other peoples' monitors it looked rather
sick. I've always attributed it to the filtering methods to separate
the brightness (Luma) signal from the color (Chroma) signal on NTSC
monitors. Some displays used a notch/bandpass filter. "Better"
displays used a comb filter that involves a one-horizontal line delay.
See this link: http://www.extron.com/technology/archive.asp?id=ntscdb3

On an Atari 8-bit running APAC mode, this had the desirable effect of
bleeding the color (from the 16 hue line) into the next line of 16
greyscale (and probably the other way around for the next line).

William Kendrick wrote:

Not that Im disagreeing, because Ive heard many horror stories of commodore
equipment, but all I can say is Ive had almost zero problems with my gear
over a period of 18 or so years.

Ive had one 1084S blow..... and one really old c64 I acquired recently blew
a CIA.... and thats pretty much it. I have stacks of gear, and it all just
seems to work....

I must be blessed or something.

Because the C64 sold more, so more and better games (that "and" is not redundant -- both better games and more games) were released for the C64, and with more and better games released for the C64, more C64 were sold.

Kind of like Micro$osft windows today.

As far as explaining after the fact why the C64 was a hit, bit fat hairy deal. Its explaining before the fact what is needed to make a hit that is a big deal. Clearly Commodore lost that ability shortly after the C64 was released.

> out

HAH! Even we Atari fanatics hate the keyboard on the 400 (personally, I hate the whole damn machine). The 800, however, has/had a great keyboard. Never had an XL, but the keyboards in the XE line suck. SUCK. SUCK. SUCK. The guys I telnet chat with are used to hearing me complain about how it feels like I'm typing in oatmeal with my 130XE.

Maybe one of these years I'll get the keyboard kit for it to make it feel less mushy. :)

Sounds a lot like you had a really bad power supply and/or serious
problems on your mains power. Though I assume you knew that the power
supply was a likely source of problems, since the C64 was famous for
flaky power supplies.

is it just me or is this argument about as dated as a stick vs a rock

sure i still have my c64c in the garage i even did the x1541 cable and
put a bunch of games off of the arnold ftp site back on disk but i grew
out of it quite a while ago

i wont be playin with it untill someone gives me a device that will
allow me to use a zip drive with it the loading time was always the
joke

i was loading rambo 3 once and forgot what game i wanted to play before
it loaded

to me the nes killed the c64

i did a bunch of school papers with bank street writer and used
printshop to make banners and cards for birthday parties for years(i
still have a reem of paper with the tractor feed werent those the days)

to be honest i bought a few games mostly from accolade and electronic
arts and every time i bought an ocean game i sould swear it was my last
but i must have bougt 5 or 6

the main reason i liked it was the ease of copying games and downloadin
them on my 300 baud modem

which was the atari computer that had the keyboard that was a membrane
i knew a guy with one of them and didnt buy an atari till the lynx came
out

One advantage I find of the Atari over the C64 is that the graphics were
always much cleaner. I think Sid Mier's Pirates on the Atari 8-bit would be
nice. The swordfighting duos would be the hardest part to pull off. For the
ships in battle, I think two players combined for each ship would do for two
colors (usually black with white sail) and two missiles combined could be
used for the gunfire. It would have been nice, oh well :) I thought the
Atari ST Pirates! was nicely done especially with a harddrive. The C64
Pirates was a pain with all the load times.

 > the keyboards in the XE line suck. SUCK. SUCK. SUCK.

You're apparently unfortunare enough to have late, chinese 130XE. Keyboards in
those really do suck. However, a bit earlier XE computers - I have one, bought
it in 1988 - have different keyboards, so called "on springs", and typing on
that is really very convenient.

Nothing beats the 800 in that matter, though.

KMK

this is true, back in the 80's I got a 130xe for Christmas when they
first came out and the keyboard was nice. It's long gone :-(but I
recently bought a 65xe (actually the same as a 130xe minus the extra
ram) it was one of the late model NTSC XE's and the keyboard is pretty
bad! It doesnt bother me, because to be quite honest Id ont do much
serious typing on it... but it is mushy!

3 days left in the AFL Football tourney on The DarkForce! BBS folks...

You've still got time to enter into a division and make it into the playoffs.

One lucky player will take home a $25 prize! :-)

Yeah, I never do...except when the original post does. I usually just hit
reply without changing any of the ngs.

Balderdash! Microsoft, Intel, Mismanagement, and Progress killed the
pair of them. This argument is about as timely as a Frank Sinatra single.

I have here an excellent 1050 drive complete, boxed in excellent
condition but it refuses to start. The mechanics seem as new but the
PCB has had its day. I'm looking to buy an old 1050 that can be in any
condition but must have a working PCB (the drive itself can be
knackered, missing etc) so I can do a switcheroo. Even just the circuit
board would do.

The only ones that turn up on ebay seem to be fully functioning, now is
the chance for you to get a bit of money for an old drive carcass that
just lies around.

Emails to dunxuk at aol.com, I'm in the UK. Thanks again everyone!

I don't know if this is rare or not, but I found myself in possession of this
single sheet of paper that is a correction from Atari for the 410 Operator's
Manual.

The only 410 Operator's Manual that I have right now is C014810 Rev. 2, and
already has this identical information on the back page. So presumably this
correction sheet was to be paired with Rev. 1 of the manual.

Anyway: http://home.centurytel.net/hunmanik/410insert-os255.htm

I need to find a program for Windows or DOS. The program I am looking for is
to transfer the files from MSDOS to the image ATR without the Atari 8bit
emulator.

Thanks!
Jack

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)

This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

If you're looking for a German ATARI group, try fido.ger.atari. Google Groups does still support this one.

Well throughout the years many have speculated what Atari could have done differantly that would have kept it going strong for years to come. After doing some thinking this is what I came up with.

Well, lets start with the 5200 system. It was an ok system, but it seems after the release of the 5200 things started to take a slide downward for Atari. If they did things differantly with the 5200 would it have helped Atari out? Well, Atari did invest tons of money into development of the 5200 only to hack up an Atari 400 in the process. I think the 5200 should have been compatable with 400 carts from the start. Maybe add some goodies to keep the 5200 very compedative against Coleco and maybe even survive the game crash. Give it stereo sound with something like a Pokey2. Same great pokey, but with 4 channel left and right. Maybe even add something for digitized sound like Covox upgrade did on the 8-bit. Give it a controller like the 7800 had, but add the pause button. Make the keyboard an add-on device. Don't need fancy full stroke keyboard, after all it is a game machine ;) Also add an audio cassette port for STANDARD home tape players. Imagine game saves, or buying new levels for your favorate game. It would be a supercharger done right. Hell even make it so you can boot 400 tapes as well, or make some el-cheapo games on tape. Higher baud rate wouldn't hurt as well. Forget disk drives at that time. They cost way too much, and if you could afford one, well most well get a computer as well. Leave on the 4 joystick ports.

Next the 7800. Well, if that 5200 would have gone off without a hitch would there have been room on the market for the 7800? Maybe 2600 fans would have thought so. So, for the love of god, give it a damn Pokey Chip, add in extra 16K of ram, and release it in 84 already.

8-bit computer lime. Well, the XL line was ok, but could have uded some tweaking as well. Add in a Pokey2 chip, and digitized audio, but have one more system that would have been higher up than the 800XL. This one would have 128kram at least, or maybe even 576k. Built in 80-col chip, seperate antic banking like the 130XE, Function keys like the 1200XL, but full stroke. And let the 1050 be a DSDD drive. then let this be the end of the 8-bit line, and drop the XE one then.

As far as the ST line, well good idea on paper, but it should have been scrapped. Atari's option would have been beg Amiga for forgiveness, if not, then upgrade the 8-bit line to a 16-bit. 65016 CPU, enhanced Antic chip, for more colors, and for sound the Amy chip. This system would be

mostly compatable with 8-bit stuff, but ofcourse, not 100%, and still
would have given Commodore Amiga a good run for it's money.

Then the XE game machine, would this be needed anymore with the better
5200? Well, maybe as an update. That would be the time to give it a
disk drive port, 64K, full stroke keyboard, and maybe even an Amy chip,
and updated Antic Chip. Look out NES!!

Just some thoughts of what SHOULD have been

Atari made so many mistakes, it is difficult to try to pick and choose,
but...

In my opinion, the 5200 should never have been. It was a rush job by
Atari to try to buy them a bit of time (not sure where you get the idea
that they invested tons of money in it, since it was basically an Atari
400 in a new case). They should have gone directly to the 7800
instead, since it offered backward compatibility -- it was really an
improved 2600, while the 5200 was a whole new producte line. Of

course, Atari should have discontinued the 2600 after releaseing the
5200 and 7800, but they couldn't break themselves from that revenue
stream. So they ended up supporting too many machines at the same time
and confusing consumers as well.

But at the end of the day, hardware doesn't matter much. it's all
about the games! Atari simply stopped developing new games that people
wanted and instead tried to rely on remakes of their old titles. That
was their ultimate mistake.

I currently have a DIN to 4 RCAs cable from Best Electronics, which is
connected to a 2-RCA to s-video cable. The whole thing is like 12 feet
long, and I'm sure I would get a better signal by having a short,
straight connection to s-video.

Does anybody know if I can buy a cable like this anywhere? I know I
could build one myself, but I want to get a nicely done one...

My personal favorite is this:

http://www.a8maestro.com/sites/mtgcat/proda8/eh0101.htm

It is very well made and produces the best quality S-Video I've seen with
my Atari. If you have an 800XL (no chroma output), you can still produce a
somewhat lesser quality S-Video (still better than composite) by crossing
the video and chroma jacks with a short cable.

Originally, the 5200 was a project by Nolan Bushnell's Atari to replace
the 2600 after a couple years...and by that I mean the 2600 was not
suppose to have a long life span as it did. (While it was great that
there were a lot of carts that pushed it way past it's limits, the
glutteny of those same carts helped lead to the Crash.) But when Ray
Cazar took over, he scrapped the project and then changed it to the 400
computer to compete with the Apple II.   The 5200 was brought
out of mothballs to comepete against Intellivision and later
ColecoVision and the blotched up changes were made by marketing like
the bizzare controller and the fact that you can't just play 400 carts
without redoing the whole coding dispite being virtually the same
machine.

So had Bushnell gotten fired by Warner then most of Atari's game made
in the early 80's (Asteroids to Yars' Revenge) would have been on the
orginial 5200 while the 2600 line up would have ended in the 70's.
Might have this prevented the Crash? Probably since Atari would have
"renewed" the game system cycle and there would not have been the big
glutteny of bad games. They 'might' have added a keyboard and stuff to
make it a home computer to compete against the Commodore 64, but who
knows. (Would have kicked their butts anyway if Atari came out with
the Amiga... ;)

Not sure if you have seen these:

http://www.textfiles.com/games/ATARIMAIL/

It is 10 years of internal mail (1983 - 1992) from Atari / Atari Games
- Makes for a good read about the problems they were having there.

Bill H - www.ts1000.us

I noticed Atari DOS 3.0 that supports two formatted density, Single and
Double. Is Double Density true ? or Enhanced-Density? I got confused!

Atari DOS 3.0 formats 1024 bytes per block. Is it true? I think DOS 3.0 has
alot of wasted space. Is it same as Atari DOS XE 1.0?

Atari did develope a seperate system to replace the 2600, but it
proved too difficult to program and that is why they went with the
400. As far as competitive with the Colecovision, the 5200 is
techinically the more system, and regardless of anyones opinion it was
competitive the main problem with the 5200 were the horrible
controllers and of course timing (the videogame crash) but if they had
reelased it with decent controllers it would of done much better.

>
>Next the 7800. Well, if that 5200 would have gone off without a hitch

>Chip, add in extra 16K of ram, and release it in 84 already.

If they released the 7800 in 84 and put full support behind it maybe
they would of had a chance, but the Tramiels prob didnt have the
resources or desire to support that platform. A better alternative:
If Atari had gone ahead and rebranded the NES as an Atari... they
really blew it by turning Nintendo down.

>8-bit computer lime. Well, the XL line was ok, but could have uded some
>tweaking as well. Add in a Pokey2 chip, and digitized audio, but have

>but full stroke. And let the 1050 be a DSDD drive. then let this be the
>end of the 8-bit line, and drop the XE one then.

Atari actually had plans for 65xe with an advanced sound chip. They
also designed the 1400xl and 1450xld which had many of the features
you are talking about. It's easy to look back and say they should of
added all these features, but rem by this time 8bit computers were low
end cut throat priced machines (mainly due to commodore 64) and atari
was not going to make a super 8bit that would compete with the 520ST.

The XE line was basically a redesiged cheaper to manufature XL's, so I
dont any reason to drop them.

>As far as the ST line, well good idea on paper, but it should have been
>scrapped. Atari's option would have been beg Amiga for forgiveness, if
>not, then upgrade the 8-bit line to a 16-bit. 65016 CPU, enhanced Antic
>chip, for more colors, and for sound the Amy chip. This system would be
>mostly compatable with 8-bit stuff, but ofcourse, not 100%, and still
>would have given Commodore Amiga a good run for it's money.

When you say advanced 8-bit, you are basically describing an Amiga,
which is the real successor to the Atari 8bit.   Compatibility with
8bit would not have been worth it.   Atari blew it again by letting
Amiga slip thru their fingers, but who knows if they would have driven
that platform into the ground worse then Commodore...

>Then the XE game machine, would this be needed anymore with the better
>5200? Well, maybe as an update. That would be the time to give it a
>disk drive port, 64K, full stroke keyboard, and maybe even an Amy chip,
>and updated Antic Chip. Look out NES!!

the xe game system had a drive port (SIO, 64k and full stroke keyboard
but it was just cobbled together to try to capitlize on their 8bit
inventory and the NES popularity... Atari just didnt seem interested
in updating the 8bit line at all. IMO Atari could done would of been
able to compete with the NES at that point, they could of however
worked on a 16 console and get that out for the next gen (maybe even
STE game system) which might of had a chance.

Dos 3 was single and enhanced densities - no true double density. Yes it
wasted a lot of space with those 1k blocks - it was a real dog, IMHO, the
worst one ever produced.

I think they should have released something like the 5200 as soon as the GTIA chip was finished. But it should have been simply a low cost A8 computer for games. Lose the keyboard, SIO port, and other unneeded things but retain compatibility with as many existing cartridges as possible. Making developers have to release separate versions of games for the 5200 and A8 when the capabilities of the systems were the same was definitely lame.

Nah, I think the NES would have been a better bet. Either way, I think
Atari should have been looking beyond 160x200 displays and shared 1.79MHz
8-bit buses at this point.

An updated A8 would have been (would still be?) cool. Throw the '816 in
there running at twice the speed and give ANTIC a 16-bit bus to RAM and it
would be almost to the Amiga's level, but with linear and character-based
graphics modes instead of planar.

Combine the 7800 with the Amy sound chip would've been an NES killer. The
problem with the 7800 is that they didn't upgrade the sound from the 2600.

The 5200 should've never been made, and the resources for the XL line
should've been poured into the 7800. Drop 2600 compatibility, but make
it fully 8-bit computer compatible. Atari's mistakes could fill a book,
but their biggest one is not investing in R&D. The 8-bit line was essentially
unchanged from 79-92!

There are multiple copies of the Atari System Reference Manual (Bob
DuHamel, 1987) around in the internet, and all have some text missing in
Chapter 15 Displaylist:

 CHAPTER 15

 DISPLAY LISTS

     [some of this file was lost...]

     chip also has a memory scan counter. This register scans the display
     buffer for data to be interpreted and displayed. Once loaded, the
     memory scan counter's 4 most significant bits are fixed. The result
     is that the memory scan counter cannot cross a 4K memory boundary
     (i.e. $AFFF to $B000) without being reloaded.

     DISPLAY LIST INSTRUCTIONS

I have found the original text on some disks:

CHAPTER 15

DISPLAY LISTS

The program which runs the ANTIC chip is called the display list. Much like a microprocessor, the ANTIC chip has a program counter, called the display list counter.

The display list counter is a 16 bit register. However, the six most significant bits are semi-fixed. These bits can only be changed with a jump instruction. The result of this is that the display list counter cannot cross a 1K memory boundary (i.e. $A3FF to $A400) without using a jump instruction.

The ANTIC chip finds the address of the display list in DLISTL [$D402 (54274)] and DLISTH [$D403 (54275)]. SDLSTL [$0230 (560)] and SDLSTH [$0231 (561)] are the shadow registers for DLISTL and DLISTH.

The ANTIC chip also has a memory scan counter. This register scans the display buffer for data to be interpreted and displayed. Once loaded, the memory scan counter's 4 most significant bits are fixed. The result is that the memory scan counter cannot cross a 4K memory boundary (i.e. $AFFF to $B000) without being reloaded.

If you host some version of this manual, please update you version ;)

Best regards

Carsten Strotmann

It wouldnt of mattered if the 7800 had better sound, it still would of
had the same library and came to the party too late. NES was an
unstopable force by the time the 7800 was released.   IF Atari could
of got the 7800 out there instead of the 5200, well then maybe they
would of had something.

The problem is once the Tramiels took over they were focused on
beating Commodore and the ST line, so we would never see any advanced
8bit (like the c128 or Apple IIgs) for fear of competing with the
520st. Also they would never fully get behind game system, with the
7800, xegs, and lynx it seemed after the first year when it was clear
they didnt have another 2600 on their hands, they would half heartily
support the platform. It wasnt until the Jaguar they really focused
the company on videogames, but by then it was too little too late.

(newsgroups have been down here - been trying to post this for 3 says!)

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

--
_/_/_/

days...

Winner takes home $25...just like that.

When was the last time you got paid to have fun? :-)

The 1st one I learned. Then when 2.5 came out switched to that. Then
went to Sparta.

I concur. The XEGS should've never been released, and the 7800 and Lynx
should've been marketed harder. In fact, everything should've been
marketed harder!!!

Enhanced density. DOS 3.0 was widely criticized. Wasteful, and not very
compatible with older 2.0 disks. Go with its successor, DOS 2.5. Or, if
you want double density, go with MyDOS.

That reminds me... I remember reading an article a long time ago that due to
the rather lame sound of the 2600/7800, some game makers actually put an
enhanced sound chip in the cart right along side the game. Wasn't it the
POKEY, same as the computers?

The POKEY was only in Ballblazer and Commando, and it was only used for
sound.

Not that much in fact. Basically you just need 2 sets of counters: one to
count character positions in a line, say modulo 40.
Then the lines etc. The other is a straight binary up counter for linear
addressing. We are talking about some 4 chips extra
of standard logic. $1 or so in parts, but they need to be routed on a board
too.

Yeah, I remember reading about this a long time ago. I didn't know the POKEY
was only included in 2 games.

    Does anyone know of a mod to improve the video quality on a XEGS? I see
documents on the XL and XE series, but nothing specifically for the XEGS.

I'm trying to improve the composite video on Ben Heckendorn's 800 XE laptop.

Thomas

You've described APAC mode ("Any Point, Any Color"). Alternating each line between 16 hue mode and 16 greyscale mode gave you 80x96 "pixels" (the interlacing was quite obvious), which kind of looked like 256 colors.

There's also a higher resolution variation of APAC mode which actually alternates two screens, one with the hues on even lines and greys on oddl ines, and the other with the opposite. That gives you 80x192, 256 colors, with a little flickering.

This provided a kind of washed-out representation of the Atari's true 256 colors (i.e., compare it to a solid, non-flickering screen of shades where the shaded pixels' hues are actually changed via DLI, rather than combined with other hue pixels by your eyes' persistence of vision).

After that came ColorView mode, which didn't use the 16 hue mode, but instead interlaced 3 screens containing 16 shades of red, 16 of green and 16 of blue. That gave you 80x192, 4096 "true color" colors, with some flickering.

Mostly, you'd notice large solid primary light colors (like a section of solid red) kind of rolled a little, as the screen rotated between the three images.

More recently, we got HIP (Hard Interlaced Picture) which is something like ~160x192 at 30 greys hades, and RIP, which is similar but provides colors. I cannot recall its specifications, other than ~160x192, as well...

Also note that none of these tricks "only work on PAL". In fact, since NTSC displays update more quickly, the interlacing/rolling artifacts are _less_ noticable on NTSC than on PAL.

I'll provide a little summary of the modes (that I understand), based on how the Atari shows them:

* Regular APAC (80 x 96, 256 colors)

  Line 1: 80 GTIA 16-shade mode (80x192) pixels across
  Line 2: 80 GTIA 16-hue mode (80x192) pixels across
  Line 3: 80 GTIA 16-shade mode (80x192) pixels across
  Line 4: 80 GTIA 16-hue mode (80x192) pixels across
  ...
  Lines 1 and 2 together represent the first of ninety-six 80-pixel-wide rows of APAC 256-color pixels. Lines 3 and 4 represent the second row... etc.

  Display List Interrupts (DLIs) are used to switch the GTIA chip between the two GTIA modes.

  Unfocus your eyes a little and the pixels blend together to kind of show 256 possible colors. :^)

* High-res APAC (80 x 192, 256 colors)

  First Frame:
    Line 1: 80 GTIA 16-shade mode (80x192) pixels across
    Line 2: 80 GTIA 16-hue mode (80x192) pixels across
    ...

  Second Frame:
    Line 1: 80 GTIA 16-hue mode (160x192) pixels across
    Line 2: 80 GTIA 16-shade mode (160x192) pixels across
    ...

  The First (shade) and Second (hue) frames of Line 1 blend together (thanks to Persistence of Vision) to form the first of one-hundred-and-ninety-two 80-pixel-wide rows of Hi-Res-APAC 256-color pixels. Ditto for the two frames of Line 2... etc.

  DLIs are used to switch the GTIA chip between the two GTIA modes. Vertical Blank Interrupts (VBIs) are used to flip between the two frames every 60th (NTSC) or 50th (PAL) of a second.

* ColorView (80 x 192, 4096 colors)

  First Frame:
    Line 1: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
    Line 2: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
    Line 3: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
    ...

  Second Frame:

```
    Line 1:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
    Line 2:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
    Line 3:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
    ...

  Third Frame:
    Line 1:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
    Line 2:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
    Line 3:  80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
    ...

  The First (red), Second (green) and Third (blue) frames of Line 1 blend
  together (thanks to PoV) to form the first of one-hundred-and-ninety-two
  80-pixel-wide rows of ColorView 4096-color pixels.

  The First (green), Second (blue) and Third (red) frames of Line 2 blend
  together (thanks to PoV) to form the second of one-hundred-and-ninety-two
  80-pixel-wide rows of ColorView 4096-color pixels.

  ...etc.

  DLIs are used to switch the the palette between red, green and blue
  on each scanline.  VBI are used to flip between the three frames
  every 60th (NTSC) or 50th (PAL) of a second.

PS - There are also two additional ColorView modes:  160x192, 64 colors
and 320x192, 8 colors.  Same trick, different Atari hardware modes.
(Either three frames of 160x192, 4 colors; or three of 320x192, 2 colors.)

PPS - These modes aren't used often outside of demos and GIF and JPEG decoders
and viewers on the Atari.  They eat a lot of memory.  (APAC takes about 8K.
Hi-Res APAC takes about 16K.  ColorView takes about 24K.)

Ditto, thanks Jason! :)

> - You mentioned that Atari is incapable of displaying more than two
> shades of one color on one scan line in hi res,

If you overlay sprites, you can have two shades of five colors, or 10 colors.
But you're limited to where and how you can place the sprites.
(They can be up to 4x-as-wide-as-usual, which causes each of the 8 pixels
in a sprite to be as wide as 8 hi-res pixels.)

There's also a cycle-counting trick, combined with a bug^H^H^Hfeature of
the video chips that allows the Atari to switch fro "hi-res, 2 shade" mode
to "low-res, 16 shade" mode, mid-scanline.

This has been done in demos, for example, to show high-res text on the
left, with morphing photographs on the right.

<snip>
> Is that because you cannot change the color registers fast enough,

Yeah, it's hard to change the color registers mid-scanline. Mid-scanline
tricks (like the one described above) are typically just that... they only
work at around the middle of the screen. And don't put too any pixels
in the middle there, or it might not look right part of the time.

> or because you cannot sync the change in the color registers precisely? As
> far as I understand the C64, you can have two colors in each 8x8
> region, right?

The C64 has this 8x8-region thing that I don't understand so well. :^)
On the Atari, the playfield is a large array of memory, and the 'indirection'

comes by way of the color palette. On the C64, it looks like the large
array of memory is _also_ affected by a smaller array (1/64th the size or
less?) of "what kinds of colors go in which 8x8 region".

:^)

> - As far as speed of the machine is concerned, C64 is at 1MHz, and in
> low intensity situations there is one "bad" line every eight scan
> lines. The Atari's CPU on the other hand gets interupted by ANTIC on
> every scan line,

Well, unless that scanline is "off". (Bob Puff's SuperARC and SuperUnARC
tools, for example, simply showed a few lines of informative text in the
middle of the screen while they did their compression or decompression.
The rest of the screen was "border", meaning the CPU wasn't interrupted.)

> but the CPU goes at 1.7MHz so I would assume that it
> still means you have more clock cycles available on the Atari to do
> stuff during the H and V blanks, right?

That sounds right, but I'm not a C64 expert. :^) (And, of course, how much
time you had during VB depending on whether you were on a PAL or NTSC system,
which led to all kinds of annoyances when trying to watch cool European
demoscene stuff on a US Atari ;^) ... fortunately, if you have a good monitor
with VHold, you can just plop a PAL ANTIC in and things work great!)

Hi,

> I'm assuming that as the graphics get more complex, the Atari will

> start stealing even more cycles than the C64, so the difference will
> get smaller.

No, it doesn't. Actually, the standard 40x24 text mode is the most
complex mode because it requires DMA for hi-res graphics and DMA
for character cells. All other modes are either bitmapped, meaning that
there is no character cell DMA, or have a lower resolution, and thus
require less DMA cycles. Concerning DMA, the antic modes 2 and 4
(basic modes 0,12) are identically complex, followed by the modes E
and F (basic modes 15 and 8), which have the same resolution as 2 and 4,
but are bitmapped.

Games typically used the mode 4, or the text-mode 6 and 7 which are
both "cheap".

Concerning your calculation, you would need to add the DMA cycles required
to fetch the display list (one or three slots, depending on whether the
memory scan counter is to be reloaded) and 4 to 5 slots for Player/Missile
graphics. Memory refresh cycles can be potentially delayed/overloaded by
other cycles, so the calculation isn't accurate either. It's harder than
one might believe.

So long,
     Thomas

In my experience the XEGS already has the best composite video of at least
the 1200XL and the 800.

It's crystal clear on an HDTV. Not sure if any mods were made for it.

I loved it when people mange to push 8-bitters beyond their perceived
limits. Are there Atari emulators that are accurate enough to display
these demos ?

> <snip>
>

I guess that should be possible in the C64 as well but don't recall ever
seeing it done. Probably because there is no real need for it on a C64.

>>or because you cannot sync the change in the color registers precisely? As

Almost correct. In hires mode (320x200) the screen is divided into 8x8
pixel blocks. For every 8x8 pixel block there is a byte that defines the
two possible colors in that pixel block. The upper 4 bits of determine
the foreground color (pixel on) and the lower 4 bits determine
background color (pixel off) of the associated pixel block. So besides
the 8000 bytes of the pixel data, also is 1000 bytes of color data.

The multicolor hires mode (160x200) uses two bits for each pixel which
is twice as wide as a "hires" pixel. Multi-color pixels are organized in
4x8 pixel blocks. For every pixel block there is not only a color byte
but also an additional color nybble. So every 4x8 pixel block has 12
bits of color data associated with it. Those 12 bits are sufficient for
defining three colors, the fourth color is the background color which is
shared across the screen (of course it possible to change this color
every line).

If you feel that 2 color for 8x8 pixels is a too limiting and that 4
colors for 4x8 pixels still not good enough enough, it is possible to
fool the VIC chip so it allows more colors per pixel block. However this
requires a lot of CPU cycles; while rasterbeam is between the top- and
bottom borders the CPU will be fully occupied with the VIC chip.

Another way would be to use sprites to overcome the color restrictions

of the C64.

  >>- As far as speed of the machine is concerned, C64 is at 1MHz, and in

> The rest of the screen was "border", meaning the CPU wasn't interrupted.)

Also the C64 runs faster when the screen is turned off (only the border
color is shown in this case). Like the Atari it also possible to turn
off only a part of the screen using raster interrupts, though that would
waste some CPU cycles (for the handling interrupt and setting up the
VIC). I doubt it would be worthwhile on a C64 since the VIC steals only
a little over a 1000 cycles of the ~20000 cycles each frame has.

>>but the CPU goes at 1.7MHz so I would assume that it
>>still means you have more clock cycles available on the Atari to do
>>stuff during the H and V blanks, right?
>
> That sounds right,

Then I'm afraid it is up to the Atari guys fight with the Sinclair boys
in the next flame war about which system is better at doing vector
graphics :-)

I think Atari800 can finally handle this. Atari++ probably too, as well.

Howdy David

This probably will not help you much, but it looks like the CO25953 and
two of the RAM chips have been added at a later moment.

Which, while I am typing this, makes me think that the OS might be
replaced by an OS from the XEGS, which has the extended memory test in
it.

Why, exactly, would a company that specializes in vintage software need
to run a clearance sale? Are you trying to clear the shelves, waiting for
the new Atari models to arrive for '06? Are you trying to cash in on those
Jaguar games, before these newfangled Playstations get popular?

I'm buying out an Atari Dealer. I have half of his ST Games/Software and I
need to make Room on my shelves. I'm also doing this to help fund a buyout
of the other half.

I have seen SmartDOS 6.1, lastest version but I got 8.2D, it had never seen
before. What is the difference between 6.1 and 8.2? I see no difference. is
it fake?

Thanks!
Jack

Hey fellas,

Now a bit of bad news (if you can call it that) when I select bank 0 I
get $0-$3FFF at the bank space, and when I select Bank 16 I get
$4000-7FFF (like if I wasn't banking) SO WHAT!!!!! I still have 62 16K
banks. I just have to remember 2 are invalid. I'm not EVEN gonna try to
correct it...62 16K banks!!! thats 20 1/2 800's worth of memory.
(Remember I'm 3 wires away from 4 Megs..I just cant find a simm!)

ANYWAYS! Enough RAMbling (ha ha) Tonight I'll start on the harddrive
interface (I already have Sijmen's MyIDE in my XL..IT ROCKS!!!) but on
the 800 I'm gonna map it somewhere else in memory and use all 16 bits.
Once I stick in all the goodies I want in there, and organize, clean
up, and get a procedure going, I'll post some schematics and pics

Ralph

Well, tell me this... Is that chip the ROM OS, or BASIC? I've never screwed
with the ROM chips on any Atari. I was looking at the 32-in-1 OS urpgrade
installation instructions over at atarimax.com and it says the OS ROM is the
chip directly above the one in question on my system.

do you think a similar mod could be achieved on the Atari 400?

In January, 1981, California Digital (a component discounter) was
selling eight 200ns 4116's for $30, and that was a considerable
reduction from the "standard" price of about $75 and the Apple price
of $150 for the same set of eight DRAMs. I bought 2 sets.

The price of DRAMs was pretty volatile then, as now. A week after
I placed my order, the price of a set of eight went up to $40.

Of course, the general trend (averaged over a year or so) has always
been strongly downward--until the chip type became obsolete for new
designs. A typical slope is that the price halved every year.

It would have been very difficult to find 4116s for $18 per set of
eight any earlier than mid-1981.

You are absolutely right. After thinking about it a bit I decided that
prices dropping from $200 down to $18 could not have happened in just
two short years (nevermind less).

I dug out my old A.N.A.L.O.G issues (later Analog Computing) to find the article I used for reference for my memory upgrade. I had two surprises 1) The first issue was published in 1981 not in 1980 as I had thought and 2) the article to which I just mentioned did not appear until issue 6, published mid-1982.

Even then I did purchase the 4116s at half the price I expected to pay. (ELI Electronics of Cambridge MA was quite a place for electronics, new and surplus, at basically wholesale cost).

I appologize to one and all for my faulty claim. The actual date was mid/late 1982.

Darren Salt wrote:

> True. But the *layout* of the display memory was certainly influenced by the
> CPU.

In the case of the Apple II, the (somewhat unusual) layout of display
memory was a consequence of using the video refresh to accomplish the
refresh of the DRAMs.

The result is that no special refresh circuitry is used, and, since
all video accesses occur on the alternate half-cycles not used by
the processor, there is never any interference with the processor
for video or DRAM refresh.

A little cleverness simplifies a lot.

As Linards points out, the Apple][had color long before the
Commodore computers. And it was able to do so without using any
more memory than for a monochrome display. It's color is all
NTSC "artifact" color--an extremely clever design in 1977,
inspired by video games.

The Apple][video generator is a very simple LSTTL design, using
a 14MHz shift register chip to generate the video signal.

However, I recently discovered that the connecting points are on the
interface board, so it can be added fairly painlessly. <

Short update. I clipped a cart jack off a dead 65XE and soldered it
in. Sure enough, it works. Now my OSS carts can get back into
action.

Unfortunately, it isn't. I have bought several of these and they are
GREAT. I have one in my 8 bit lappy. Adds a lot of functionality for
seeing what runs on different OS without swapping machines.

The XEGS uses a single 256kbit ROM that includes BASIC, Missle Command and the OS rom. They probably ran out of one of the roms and used the newer combo roms as a substitute, hard wiring it for a single function and the smaller footprint of the old rom.

I don't agree. No matter what the screen memory layout is, the video
circuit will refresh all the DRAM as long as 128 consecutive addresses
are accessed (or all 128 combinations of low 7 address bits are used).

The screen layout is what it is for a different reason: the number of
characters in one line is not a power of 2.

Suppose you have 64 chars per line. Then the addresses can be
consecutive. Same for 32 chars like in Sinclair Spectrum for example.
Woz chose 40 chars per line. Memory was quite expensive. To avoid big
holes - 24 of every 64 bytes - he used an adder to scramble the
addresses so that there are only small 8 byte "holes".

>
> The result is that no special refresh circuitry is used, and, since

> for video or DRAM refresh.

This is all true. But will also be true in case of say a 64 char per
line display and linear memory.

Of course it is possible to have 40 (or say 80) chars per line and still
have linear addressing, like in a VGA card, but that requires a lot more
hardware.

So if I were to replace this with the MyIDE, or your 32-in-1 OS ROM, would I

be able to just cute the wires and stick the new chip in without any
problems, or am I stuck with this thing?

From the picture I'm assuming its being used as a BASIC rom. The rom above the one with the wires is typically the OS rom in the 130XE. You would need to desolder that and replace it with a socket to use another OS.

Nope, have to agree with Darren -- the display organization
looks like it was organized to speed up character printing
to me.

Here's the 13 bit counter used to iterate through the
32x192 pixel bytes (8 pixels per byte):

A BCDE FGHI JKLM

The Spectrum generates 16-bit pixel data address
from this:

010A BFGH CDEI JKLM

and attribute address from this:

0101 10AB CDEI JKLM

As Darren mentiones, this allows for fast
character printing.

But I do not believe this is a coincidence because
there are 12! possible display arrangements using
a 13 bit counter and 32x192 pixel resolution without
causing any holes in the memory organization.

Here's a possibly useful alternative that seems much
more straightforward than the one chosen by
Mr. Altwasser:

pixel address from:

010A BCDE FGHI JKLM

attributes from:

0101 10AB CDEI JKLM

If this arrangement were used, pixel
bytes 0..31 would be at offesets 0..31,

pixel bytes 32..63 would be at offsets
32..63, etc. IE the pixel display is
stored left to right, top to bottom with
incrementing downward one pixel achieved
by adding 32 to the display address,
and moving right 8 pixels (one pixel byte)
achieved by adding one to the display address.
No screwy organization as seen on the
Spectrum.

Attributes would map as expected, left to
right, top to bottom one attribute for each
8x8 pixel group.

I think fast character printing was pretty much
essential for the Spectrum, given its built in
editor liked to erase the screen and redisplay
listings frequently.

Alvin

Color which is displayed as a result of a monitor's interpretation
of a pixel pattern which is synchronous with the color subcarrier
frequency. It is often seen as false color appearing when a fine
vertical monochrome "grating" is shown on an NTSC monitor--like
a finely striped tie, shirt, or coat.

Several machines harness this effect to produce color displays.

It can also be envisioned simply as a digital synthesis of a
combined chrominance/luminance composite video signal, but the
usually very simple combination of patterns of fixed-width,
bi-level pulses at a multiple of the subcarrier frequency, in
which the pallette of colors have simple phase relationships,
is normally described as "artifact" color.

Still having my mind on this, here's an organization
that beats Mr. Altwasser's for screen printing
speed:

pixel byte address:

```
010A BCDE IJKL MFGH

same attribute organization.

Character printing:

; hl = top of character bitmap
; de = address of top pixel byte
;   in 8 pixel high character

LDI x 8

after this de = address of top pixel byte
for next character cell to right (ie all set
up to print next character).

Here's a print at calculation:

; a = row char coord (0-24)
; l = column char coord (0-31)
; exit: hl = address of top pixel byte
;  in char cell

or $40
ld h,a
ld a,l
add a,a
add a,a
add a,a
ld l,a
ret

Mr A, you should have been thinking LDIs
instead of register pairing :-D

Thanks, I have gone over every wire again, reheating the connections,
and it works like a champ now! The traces do look pretty bad though,
five of them have lifted off the board and broken off.... Tramiel
quality for ya I guess :)

But this has to happen within a certain time frame, right?

Yes they would, but I would also look in the NET. That is where I found mine.

You could do that, but I would just get a nice SVGA PC monitor, a Commodore monitor cable and a video convertor. That is what I do with my XE/XL and it works and looks great.

As Alex points out, a linear mapping would do this as well.

His point is well taken--the Apple II display mapping is motivated
by the desire to display 40 characters/280 pixels per line while
leaving as few/small holes as possible and using as little logic
as possible. DRAM refresh is not a primary consideration, since
its requirements are easily met by many mappings.

Nevertheless, the "alternate cycle free" 6502 memory usage,
coupled with a simple "DMA" video generator, negates any perceived
advantage of the Z-80 in a DRAM-based personal computer.

Commodore PET/CBM, 64 and Plus/4? All of them had linear addressable
40x25 text mode.

Take a look at my buy - it - now auctions on ebay :

http://search.ebay.com/
_W0QQsassZbobbyisgoinghomeQQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

Great for resellers or homebrewers who need cartridge shells. Many
games for only $1 or less.

All the games are NEW, boxed + instructions.

ATARI 800 XL/XE games are NTSC.

Some controllers, Paddles and Keyboard Controllers available, too.

Shipping of games can be combined.

I can accept paypal as payment and I will ship worldwide.

I started to point that out several times, but thought I would wait to see how long it took for someone else to do it. ;-) Thanks for restoring my faith in Commodore users! :-)

I would like to add the 40 column mode of the C128 to your list. The C128's 80 column mode may not count as the 80 column VDC used its own RAM, much like the PC video cards of a decade ago.

Can't remember if the other commadore monitor was a 1084 for sure but it
was better then the 1702. The only thing the 1702 had over the 1084 was
a better speaker/sound IMO.

The one I had included jacks for IBM/CGA and composite. It got used a
lot on my Tandy.

The IBM CGA cards did this; by turning the color burst on in the CGA 640x200x2 mode, you would get 160x200x16 graphics if you used the CGA card's composite output. If you were using a RGB monitor, however, you would just get the 640x200 graphics. The composite color palette was different then the RGB palette; it was similar to the Apple II's color palette. This makes sense, given that the CGA composite signal was generated almost the same way as the Apple's video signal.

However, most PC users had RGB monitors, and so got ugly 4-color graphics. Of course, not every game supported the 16-color composite mode, and often you got 4 colors even with the composite output. This was partly because of most people using RGB monitors, but also because it required more effort to program. Morever, some clone CGA cards(eg. the AT&T 6300 video cards) didn't have a composite jack.

But you guys missed out the important part of the original quote:

"Of course it is possible to have 40 (or say 80) chars per line and still
have linear addressing, like in a VGA card, *but that requires a lot more
hardware.*"

In the case of the C16/+4 a custom TED Chip, the C64 uses the custom VIC-II,
the Atari it's custom Antic chip. Try designing a video circuit in discrete
logic (Like the Apple II) then tell me how much more hardware is required to
obtain a linear 40 or 80 column mode.

Just take a look at the schematics of the first Commodore PET 2001.
There are probably more examples, but this is first one I could think of.

> I don't know if these interfaces are still being sold, but if they are,
you might want to investigate it if you are looking for an fairly
inexpensive, powerful, fast HD alternative. <

Last Update (probably)

I was advised that these interfaces are still being sold in parts of
Europe. Note that this is slightly different than my interface, using
easier-to-find components. Mine is one piece, and this one is a
two-piece design with a cable connector. It appears to include the
cart jack built-in. Here's a link:
http://www.allegro.pl/show_item.php?item=79158011

Incidently, that price would be in the $41-$42 range in US$

I still have large qts. of ATARI 800 XL/XE carts One on One and a few
others.

www.atari2600.de/c/oneonone.jpg

New and shrinkwrapped, over 100 copies available, perfect for resellers
or homebrewers who need cheap XE carts for modifications.

I offer 100 of them on ebay for $170 = $1,7 / game

http://cgi.ebay.com/ATARI-800-XL-XE-100-x-One-on-One-cartridge-
NEW_W0QQitemZ8247119860QQcategoryZ62053QQrdZ1QQcmdZViewItem

There is another lot of 6 XE cartridge different games :

http://cgi.ebay.com/ATARI-800-100-ATARI-XL-XE-cartridge-games-
NEW_W0QQitemZ8247119807QQcategoryZ62053QQrdZ1QQcmdZViewItem

I can also sell these games without ebay, please ask for prices.

Shipping is overseas, a little bit expensive, but insured and usually
pretty fast, takes onl 2-3 weeks to arrive.

32 Euros ($37) up to 5000g
42 Euros ($50) up to 10000g
62 Euros ($75) up to 20000g

A single XE game weighs about 110-120g, depends on the game.

If you're interested, please bid on the ebay items or write to
ulrich_sternaxe@gmx.de

Bought them from a warehouse some years ago. Need the room now.

I will also sell different games than the ones on ebay, but ebay does
not
allow "choose your games" auctions, so you have to ask for a list.

Greg mistyped. That's atarinews.org, not .net. The Atari chat is every
Tuesday night, starting at 9 pm Eastern Time. The login is bbs, the
password is also bbs. You'll then be asked for a user name and password.
Then press Enter ("Return"), then "T" (for "Talk"), "Enter", "C" (for
"Chat"), "Enter", and a Chat ID. That'll get you in the room - the rest
is up to you.

I'm happy to announce at this time that The DarkForce! BBS is resuming its
time honored tradition of monthly $cash and prize giveaways! Starting Jan.
the 1st, 2006, we will have a $25.00 prize going to the winner of one
select game, as well as one lucky Atarian winning a free subscription to
ST Magazine.

Thanks! :-)

the Altair, and it was first so it set the standard. CP/M was chosen
for business because it left so much RAM for big "business" type
applications. 80- collum displays were chozen for business because it's
the standard typewriter width. The Z80 was chosen for business because
it would run CP/M and because it was better (improved later design, got
there before(?) the i8085) and, at least at first, cheaper, than the
8080.

I think the guy who said the 6502 was chosen for the home market
because it was cheaper is probably right, and the home market was also
where color graphics were wanted.

What about the 6800/09? It was at least technicly superior to many
other chips available at the time, and just as good as the rest. Why
was it so rarely used? I've noticed many early 680x computers used the
realitively poor 6847's b&w predecessor. did that have something to do
with it? or was ti just too expensive? or too late?

But it *is* better...at least IMHO :)

Hmm...I'll have to see what an ancient local electronics dealer has. I
know he has tons of old stuff left over from the old days, when he
sold, among other things, lots of Atari stuff. After Ive cleaned him
out, I'll post his address here and let you all go wild.

A collector's item is worth whatever some fool is willing to pay for
it.

A dollar is worth whaterver some fool will pay it for.

To fully understand economics, mix lage amounts of LSD, cocain, and
gasoline, and inject them directly into your brain...

The 680x processor series were too expensive, which inspired Chuck
Peddle too leave Motorola and develop the dirt cheap 650x series at MOS.

Can't blame the 6809s alone. Commodore made a clone of the 6845, called
the 6545, and used it in the later PET/CBMs (4032, 8032, etc.)

-uso.

I know about the gold standard, and when we came off of it. You must

think no one knows anything but you. All I have said thus far is that your ranting about values was majorly flawed to the point that I perceive you as stupid. If that makes you feel that you know something about the fact that we were once on a gold standard, and the rest of us don't (thus reminding yourself of your own intellectual superiority) then go ahead. All it really shows is that you keep playing the fool. Fool.

Right. The C64 has no true monochrome mode. However, monochrome may be
simulated (or emulated) on any color system by using white text on a black
background, black on light gray, etc.

Or, in other words, selecting only black, white, or shades of gray for the
display make the it appear that monochrome is being used while the computer
is really in a color mode all along.

Note: Some computers with color capabilities may have an actual monochrome
mode available, but not the C64.

Ok, found a manual, photocopied. I will include it with the auction. I
guess around 10pm CST.

  According to Chuck Peddle in "On The Edge - The spectacular Rise and
Fall of Commodore," the 6800 costs $300 in quantity and the 6502 cost
$25 in quantity. 'Nuff said.

You amaze me, Sarge. Somebody had confused market value with intrinsic value and I attempted to show the difference. Was anything that I said inaccurate? Absolutely not!

So, if what I said was accurate, how do I look like the fool? It was you and Cortese that were insisting that I was wrong. I wasn't wrong!

Oh, and I mentioned the gold standard because that's when money had intrinsic value. The almighty dollar hasn't had intrinsic value since the gold standard was abandoned. It's also been a long time since we saw $20/ounce gold. (That's the price that gold was fixed at!)

Interestingly enough, gold is still used as a hedge against inflation and economic instability. Do you know why? You guessed it! It's because gold has intrinsic value!

As for why you perceive me as stupid... Well, I'm of the opinion that you're a very simple person and that you're quick to discount anything that you don't understand. Then, like most simple people, you attempt to spin some whacky fable to add depth to your false intellectual facade. Honestly, you remind me of somebody that works for Richard Costly-White!

The Apple I board was designed to take either a 6800 or 6502 CPU, and
the board's legend overlay even shows which components need to be added
to use a 6800. If it had shipped with a $300 6800 CPU though there is no
way in hell the whole computer could have sold for $666.66 retail like
it did!

I believe its a hardware not responding error. Something like no ACK...
Could be wrong...

You are low on the RAM price. 4116 RAM was going for $200
at the local electronics wholesalers. I know - I priced it for my
machine. That was mid-1978, as I had gotten my system at the end
of 1977.

When I built a 32K static RAM board with 64 21L02 chips, things
were a bit cheaper - but I still had about $350 into that including
the raw board, all the sockets, the RAM and about 10 glue chips.

> Combine that with the general publics attitude that home
>computers were just a fad and you can see the resistance a
>company would have designing a color system for general use in
>those early years.

The general public didn't think they were a fad - they had no clue
that they existed. On of my early computers books by Dwyer and
Crutchfield had the title of "You just bought a personal what?"
I still see that over on the shelf with some other vintage books.

One of the most presceint of my books was called "The Home Computer
Revolution" - self published by Ted Nelson in 1977. He talked
about how predicting the future in computers was pretty pointless
and everyone would be wrong - but he was persuaded to make his
guess for 10 years in the future - and he came the closest of
anybody in his predictions.

That's one of the 'collectors items' in my computer library.
He worte that book 2 years before another I have called "Literary
Machines" where he talked about computers that you could link any
word to another reference and keep following references that way.

He coined the term 'hypertext' in this book - and 4 years later
Apple implemented about 5% of his concept.

As to color I remember listening to Stan ?? [whose last name I've
forgotten] who had a computer store in NYC and he had a color
display in his window in color - was it the Dazzler - that the
police made him take down after the first day because it was
causing a crowd on the sidewalks. He said that was the first
computer store in NYC.   He gave a talk to our local computer club
back in about 1980 - so forgive me for not remembering his last
name at the moment.

On two of my first machines the video really didn't have a lot of
processing. There was a character generator chip and you wrote a
character to a memory spot and it displayed on the screen. Pure
memory mapped without a lot of overhead like we saw on machines
that came along in 1979 and 1980.

I agree, the folks with "1337 mad skillz" are typically losers. I avoid them too. They're usually just a bunch of self-righteous hypocrites that know nothing and act arrogantly in some vain attempt to add depth to their rather shallow intelectual facade.

I'm practically lost in the Linux world too. I know the basics -- just enough to be able to kind of get something done. But I'm learning, and that's really the best that I can hope for... Cuz, contrary to what some might say, I really like to learn new stuff.

Are you sure that you want to do that neopeius? You'll probably get more money if you part it out. I would guess that an ANTIC chip could easily fetch $2000 alone from a collector. And those GTIA chips are really hot items right now. Black market distributers in Hong Kong are moving 6502 processors like crazy in the Orient. I hear that the 6502's are sought after by the Martians for use as aphrodisiacs.

You could probably turn that extra 1200XL into a cool $73,000.00 if you funneled the parts through the right channels. Careful with the 64K RAM chips though. Especially if you're living in the U.S. -- I hear terrorists are using them for improvised oven mits. You know, the plutonium and stuff...

Anyway, you're sitting on a goldmine dude!

If you're talking about the "Microsoft Softcard", it had neither RAM nor
ROM on the card. Only a Z80 processor and a good bit of 74LSxx glue logic.

But of course the Apple II dates to 1977, 5 years before the C64 came
out. That is a long time in home compter development.

Ok, so... a buddy of mine picked up a 130XE in a garage sale yesterday for practically nothing. He swung by here on his way to work this morning and gave it to me saying "I knew you'd like this, blah blah blah".

I unplugged mine and hooked it up, it fired up just fine, loaded DOS 2.5, started the RAMdisk and what not. I put it through it's paces with the diag function, all ram and rom passed.

So I cracked the puppy open to see what mysterious goodies might lurk inside. Only thing out of place is a chip centered between the two plastic keyboard stands. This thing has 4 wires soldered to the chip (2 red, 2 black) and they are held in place by a glob of hotglue. It's too long to fit in the socket completely. The chip hangs off the left end of the socket and the top and bottom 2 pins on that end have been clipped off. Any idea what this thing is?

You can see it here: http://67.187.76.221/pics/130xe.jpg

Also, you can see the 130XE I use here: http://67.187.76.221/pics/atari.jpg
:)

Thanks,

As for noticing anything different about it, not in the slightest. I havn't farted around with it other than what I mentioned earlier, but it appears to be completely normal, in behavior at least.

And that monitor... lol. It's an old ass Mag Innovision monitor. Used a "A/V A8 Break Out Box" to get an S-video signal, and pipe that through a viewsonic TV to VGA converter box. You can see that sitting on top the desk wedged inbetween the printers and the Sega CDX. :) It produces an uber crisp display. Before this I was using a 13" Sony Trinitron TV I bought from B&C Computervisions a looooooooooooooooong time ago.

Hi David-

Very Interesting... Can you tell us the chip numbers on the mystery
chip? Appears to be U4 which should be the BASIC rom. I would say
that someone made a custom 28-pin prom (eprom? -- can't tell due to the
silicone) and has jumpered it into the 24 pin space of the normal chip.
(?)

-Larry

I already reassembled the case and I'm about to go to bed. I'll gut it again
when I get up tomorrow.

The only thing that's ledgible is the last 3 or 4 numbers on the chip. I'd
have to peel the silicon off the chip to read teh whole number.

I'll let you know what I find.

I'm about 50% confident it is revision C BASIC in a 2764 compatible mask ROM. That is if the computer boots up to BASIC anyway. I used to have a Atari ASM/ED chip in my 800XL and another that booted to Galaxian for my kids.

Most if not all motherboards used the 24 pin mask programed 8k ROM. Some like the 1200XL came with jumpers and extra holes in the motherboard so you could use either type of device for the OS<no built in BASIC> but the XL/XE used the 24 pin BASIC. Only exception I can think of is the XE Game System that had built in Missle Command or something like that so they used a larger ROM.

Atari manufactured both 24 pin and 28 pin BASIC chips for their BASIC carts. My guess is the previous owner either ordered the 28 pin bare replacement chip by mistake or took apart a BASIC rev C cart and added the jumpers to make it work.

Most?
can you list them?
ZX80/ZX81 - B&W
spectrum, amstrad cpc, memotech, enterprise (to name but a few) - colour
(Can't remember what the tandy machines used, if it was z80 the only reason
they were monochrome was because it was the (mainly) pre-colour computer
era)

Tandy coco/Dragon used the 6809, iirc.
Not the z80.

The Accepted sticker is a red flag for me and makes me suspicious that this is an in house (Atari) substitiution of the standard 24 pin masked ROM for a 28 pin one. Perhaps in the latter days that this one was built, the supplier of that 24 pin ROM ran out and could only supply 28 pin ones, WAG there of course.

This is a 64x4 motherboard (often called an 800XE in Europe?) but it's slightly different than mine as far as the silk screened white lettering goes. Mine has a single A in the 'Ru UPC AA' group and mine also has the word 'action' directly under the three resistors in that same vicinity. Mine has no space between REV.1 and the 2 in the box which allows room for the word 'action' to be directly under the three resistors. Yours also has a solid white box extending out from under the sticker that on mine would be in the exact placement of '-001' of the following second line that is under your sticker:

ASSY NO. CA200519-001
first line being:
130XE(64X4)C103579-001 REV.1

I have a couple other standard 130XEs that have had jumpers placed on
the board and it could only have been done at and by Atari. Tracing
down those jumpers reveal that they are just duplicating traces that
already exist. Another wild guess is that on that run of boards they
had some troubles with those particular traces and as a hedge for that,
they just had the crew place jumpers on all them. I don't have any
signed, Accepted stickers like you do though...

Full Basic ROM numbers for mine are:
C024947A-29
(C) 1982 ATARI
-29   A8913
F834523

ALL RIGHT!!!!

I have the 1 Meg simm up and running!!! PB4 enables bank switching. An 74ls373 mapped to address 54048 selects the banks using bits 2-7. I used bits 0 and 1 for 2 LEDs (just for kicks and testing since I don't have a scope)or I can use those 2 bits for 4MEGS, one day. So right now its giving me 63 16K banks. I think the 64th(or first) bank should be the same as the main, but I think im getting something else there thats not right...I'm not gonna try to correct it. its already too much chips on the board. 63 16k banks is enough :)

I was wrong about not needing to figure out /CAS. I had to use a 5th multiplexer just to handle this issue. I guess it doesnt matter. I'm still gonna have to use ANOTHER chip anyway. I'll get some pics and

schematics up soon ;)

Ralph

PS. Thanks for the HOORAHHH!!! nope not Canadian, American from Mexican
parents.

Rory,

Let us know what it ends up going for.

Think I'll hold on to mine. But interested in how much one can
get for these.

thanks,

phantomm@bellsouth.net

The SIO ports on the XF551 are a common fail point.

Anyone using these should take care when removing/plugging
the SIO cables. The Ports are poorly secured.

No. The cost of the RAM was by far more important. There are two
classic cases:

Atari 2600: defeated its competition because it didn't need a lot of
ram to display colour graphics (but programming was complicated).

ZX Spectrum: they reduced the number of colours (2 colors per 8x8 bits
block) in order to require less RAM for displaying the screen at the
same resolution

Evenmore, taking the ZX Spectrum example: it uses a memory-mapped
display, so if you replace the Z80 CPU with a 6500 CPU and write the
same values to the same positions you got the same display no matter
what CPU you use, so, No, the cpu didn't influence the display.

Regards

JF

The poster is likely referring to the video system used in the
zx81/zx80

which makes special use of the z80 dram refresh features to get
the z80 to generate the video display, and no this can't be done on
any other 8 bit uP. The Atari 2600, as you (Peter) point out also has
simple display logic, but it still uses the TIA chip to general
horizontal
video timing, whereas in the zx80/zx81 the z80 uP does it all --
vertical
timing, horizontal timing and fetching of data to output to TV. The
only
thing missing is the modulator and parallel -> serial conversion. This
was likely the key reason the z80 was chosen for the zx80/zx81, whose
primary purpose was to get a useable computer as cheap as possible.

The dram refresh feature and the bus timing in the z80 did make it
easier to build a system with less glue logic than other cpus,
but early on that cost was easily swallowed by the price difference
between say the 6502 and z80, being the most dramatic example.

> On the other hand the 6502 had a feature that allowed display chips to

You can do hidden cycle dma access on a z80 too. Ignore the
dram refresh feature and you have 2 cycles of free access for
every instruction byte fetched. You could still use the z80
refresh signals to simplify any dram refresh hw you would
need to add.

I know exactly what you mean: the BBC micros had a teletext mode as well as
several pre-defined bitmapped modes - and, the display chip being a 6845,
some scope for custom modes.

The SMS and NES were 1985/1986ish and by that time there
wouldn't have been much (if any) price difference between
the 8 bits.

Okay if you say so. Tell you what. Take a poll and see what others
think about your skewed rants about value and declarations of
people's ignorance of what the gold standard was.

I'm comfortable their judgement. Are you?

The fact that you cannot already see the basic problem means to me
there is not much point trying to debate it with you. You can have
the last word. It doesn't matter to me. You can even say I don't
know when silver was taken out of coins if you can derive that from
some of your secret logic and associative thinking. Hehe.

The OSI Superboard/Challenger 1P was a mono only system. 1KB of video
RAM arranged as 32x32 characters (8x8 pixel font) with no guard bands
so the software constrains output to a 24x24 region that is visible on
a TV screen. No bit mapped graphics, just 128+ character based graphic
symbols.

Wow, $200 in 1978! Something big must have happened in the next year
or so. I paid $18 for eight 4116's in 1979/80.

They were used to upgrade my Atari 800 8K RAM module from 8K to 16K.
Doesn't sound like much of an upgrade but I only had 24K total at the
time and Atari 16K modules were $180+ retail.

Er, I tried to click "details" on that site and it gave a bunch of errors.

One of them even said something about a guru meditation error.... <lol>

--
_/_/_/

--
_/_/_/

that the first Apple II came with just 4K of RAM standard in 1977, but
in 1979 the smallest amount of memory you could get with a new one was
changed to 48K.

Or consider the Atari 2600, also released in 1977. It has a whopping 128
bytes (sic) of RAM. Would've made absolutely no sense in 1979.

The Apple I (alright, that one is pretty obscure).

The Commodore PET series (not so obscure).

Aside from the "collectability factor" of older interfaces, I've found that the KMK-JZ IDE hard drive is a great alternative to more expensive options. One of the really nice things about this interface is that the system can use both a Master and a Slave drive. And it is very fast. On my system, I use a 2-1/2" laptop drive as the Master, and for less disk-intensive applications, I use a Sandisk 32 MB compactflash as the Slave. Since laptop drives and CF do not require +12VDC, it really simplifies powering the devices. And since the sizes of the drives is so much smaller, the housing and space requirements are much improved over 5-1/4" and even 3-1/2" drive options.

On the downside, my interface did not come with a cartridge jack. However, I recently discovered that the connecting points are on the interface board, so it can be added fairly painlessly. I plan to do that real soon. It does require require cutting the top of the plastic interface case, but that is not a problem to me. Also, I tried to use an IDE ZIP drive as the Slave to transfer some data, but that resulted in corrupted data. I need to try it with only the ZIP attached (no HD), but haven't done that yet.

I don't know if these interfaces are still being sold, but if they are, you might want to investigate it if you are looking for an fairly inexpensive, powerful, fast HD alternative.

MERRY X-MAS!!! All

LOL!!! I don't feel "knocked" No Worries. :) I got it resolved. once I
drew the schematic on a big piece of paper, not the "post-its" I
realized I had enough space on the Multiplexer for the new address
lines and the /CAS. To make sure everything worked I broke up the
project into steps....I just didn't see the big picture :)

Ralph

Sorry for the confusion. ^_^ That Indus drive will be my late Xmas present.

BTW, the G4 is the read error code on the Indus. Accompanies that harsh "PING" that lets you know something is wrong. Oh I hate that sound. And it does spin up to 39 when it's done.

I really like those Induses.

<art_enema@yahoo.com.sg> wrote:

>Or do you recommend a C64 for that purpose ???

Definetly an Atari. Make sure you have a backup powersupply just in
case. My friend left his Atari 800 on once (with a Krazy SHootout
cart in it) for 2 years (by mistake) and it still worked fine (and
prob still works to this day altho he died... yes his atari actually
outlived him!) but the power supply got really hot and shortly after
the 2 year marathon he needed to replace it.

Why? If Mr. Wichhurst is as good a programmer as I think he is, the
nuclear powerplant shouldn't need a back up, but keep supplying him with
enough power for the rest of his (Atari's) live.

I think that this may have been attempted before in the early eighties
but computers have advanced quite considerably since then so most
companies are opting for upgrades. I personally recommend a 130XE at
bare minimum. Out of curiosity, which reactor do you plan to use an
Atari with?

heheh... I have a MyIDE issue here also. It is 12:00AM after Christmas day
and I am trying to put my IDE-CF setup together... specifcally soldering the
CF power wires onto the MYIDE cart.... but I CAN'T FIND EVEN A TINY PIECE
OF SOLDER ANYWHERE IN THE HOUSE... I have literally torn the house up
looking and of course there is nowhere to buy one tonight!!!!! SHEESH!!!

==========
This message has been cross-posted to a number of revalent usenet
groups, so please do not start a "My system is better than your system
flame war".
==========

Relying on my memory and a cursory check on a number of websites it
appears that the majority of Z80 cpu based computers had black and
white displays, where as the majority of 65xx computers had a color
display.

Now there are exceptions to this, but it makes me wonder, did the CPU
influence the display?

Is there an inherent reason why most Z80 computers had b/w displays and
65xx computers had color?

You may think it would have been cost, b&w would be cheaper than color,
but in the majority Z80 computers where more expensive than 65xx
computers.

Now it could have been display size, many Z80 computers used 80 columns
which is hard to achieve when using a TV as a monitor. But on the other
hand, with color you need more memory to achieve a good working
resolution.

So the question is, did the cpu influence the display?

I don't think that is true, at least not for home computers.

There are plenty of (early) 6502 based system which supported only B/W
display, and there are also plenty of Z80 systems which supported color
(ZX Spectrum, MSX, Amstrad CPC, Sharp MZ series, Enterprise...etc).

If we include CP/M computers (which are Z80 based) then what you are
saying might be true. However those where intended for business use. In
those days color was not deemed to be important for business computers.

> Now there are exceptions to this, but it makes me wonder, did the CPU
> influence the display?

There is no technical reason for having a correlation between color
support and the CPU.

> Is there an inherent reason why most Z80 computers had b/w displays and
> 65xx computers had color?

I don't think that statement is true, so the answer is no.

> You may think it would have been cost, b&w would be cheaper than color,
> but in the majority Z80 computers where more expensive than 65xx
> computers.

I doubt that is true either. For example the Sinclair ZX Spectrum was
significantly cheaper than most 6502 based systems, and did support color.

> Now it could have been display size, many Z80 computers used 80 columns
> which is hard to achieve when using a TV as a monitor. But on the other
> hand, with color you need more memory to achieve a good working
> resolution.

See my remark at the beginning.

> So the question is, did the cpu influence the display?

No, at least not whether the system supported color or not. Of cource
the CPU is one, but not the only, factor that affects how fast a display
can be updated, but that is another story.

I must admit I can't think of a 6502 based machine that only had mono graphics, but since all 65xx computers I'm aware of were designed for home use (and hence games) a colour display would have been essential. Most of the Z80 based machines were CP/M boxes designed for business use and back then a colour display wasn't considered necessary for serious applications. Except for the very early machines, all the Z80 based home computers I can think of had a colour display: Sinclair Spectrum (Timex), Amstrad CPC, Tandy CoCo (Dragon), MSX etc.

> Now there are exceptions to this, but it makes me wonder, did the CPU
> influence the display?

Usually the display was handled by a video processor. Texas Instruments made one that featured in most Z80 home computers in one form or another. The ZX80 and ZX81 (TS1000) had no video processor and used the CPU to generate the display. The Spectrum used a ULA (which wasn't as powerful as the TI chip, but was probably a lot cheaper at the time).

> Is there an inherent reason why most Z80 computers had b/w displays and
> 65xx computers had color?

No. As a case in point I believe you can control all the screen modes in the Commodore 128 using the Z80 rather than the 65xx. At the end of the day a CPU is a CPU. You can connect anything you want to it (as evidenced by the proliferation of IDE boards for both the Z80 and 65xx machines).

> You may think it would have been cost, b&w would be cheaper than color,
> but in the majority Z80 computers where more expensive than 65xx
> computers.

That's the business vs's home thing again. Colour wasn't considered necessary.

> Now it could have been display size, many Z80 computers used 80 columns
> which is hard to achieve when using a TV as a monitor. But on the other
> hand, with color you need more memory to achieve a good working
> resolution.

Many mono displays were text only (which is very memory efficient). In fact even on colour computers like the Commodore 64 there was usually a mono text mode available. Also a number of Z80 machines with a 512x192 display achieved 80 column text using a 6x8 font, which is just about readable on a standard TV at that resolution.

> So the question is, did the cpu influence the display?

The answer is still no. In theory you could hook up a Z80 to a modern display card and an IDE storage device and stream graphics to it (I don't advise anyone to try it though).

P.S.

While we're on the subject of graphics I've seen it claimed that the Commodore 64 can do an 8x1 attribute mode screen that is at least as big as (possibly bigger than) the 256x192 (8x1 attribute) screen on the Timex TS2068. But I can't find any reference to it in any of the online C64 documentation. Is this a user mode (Using the CPU to change the attribute byte in 320x200 mode for instance) or is it a hardware mode? Also, if anyone from the other groups knows, can any other machines manage something akin to this mode. I'm working on a project which will use a 256x192 (8x1 attribute) screen mode, and if it is possible I'd like to see it appearing on more than one 8-bit platform. (If you want to kill the cross posts, just post it to comp.sys.sinclair).

Cheers!

I probably should have specified a time period. I was thinking more of
the 78 - 82 time period and computers that were available for home use
mainly in the US (only because that is where I am and have the most
experience with). During that time period the popular computers on the
Z80 side where the Tandy's (and clones), the zx81, ts1000 and some CP/M
machines. On the 65xx side where the Apple][s, Atari's and Commodores.

One reason I was thinking that the cpu could influence the display is
that z80 had a larger instruction set that allowed you to do more with
the cpu than the 65xx. So on the 65xx side you needed more support
chips to do things that the cpu could not.

For example on a 65xx would it be possible to drive the display as is
done on the zx80 (not the ts1000 or zx81 which used a custom chip) and
the cpu with only a few off the shelf logic chips?

z80 machines have b/w displays because the z80 lacks the power to drive a
colour display. It just cant move enough colour bytes around. Every z80
instruction takes a few years to complete. The 6502 is a much better
processor, as evidenced by the superiority of all the 6502 based machines
over their crummy z80 counterparts. Besides, the number 6502 is larger than
the number 80, so it has to be better.

Compare a c64 to a spectrum, and youll see what I mean. See the nasty colour
clash on the spectrum? That's caused by the z80 being a lousy processor and
getting the colours wrong. They actually designed the z80 to run coffee
percolators, and then some crazy englishman thought it would be good inside
a computer. How wrong was he.

Perhaps you could turn a Spectrum into a coffee percolator.... I dunno.

ps. My c64 kills your spectrum. So there.

As many others have replied, there were plenty of Z80 computers with
color.

If anything, it had to do with the cost of the CPUs back in the day. In
the '70s, many CPUs were relatively expensive (as much as $200), and you
could only buy them in larger quantities like 1000 or more.

The 6502's success was in large part due to when it appeared at a
computer show in the late '70s and was literally being sold right out of
the shipping boxes for $25 each. So it ended up becoming the choice for
early "home" computers where price was important. And the Z80 got used
for "business" computers, particularly because it had CP/M available for
it.

Later on when there wasn't a price premium for CPUs other than the 6502,
the Z80 got used in all sorts of new budget computers.

In that time period there was also the Commodore PET which didn't
support color. I'm pretty sure there were more B/W 6502 based system in
that era on the market, though I don't know about the US situation.

> the cpu than the 65xx.

The Z80 had a richer instruction set than a 6502. But that doesn't mean
that the Z80 could do things a 6502 could not. However on 6502 it may
very well take more instructions to do a certain task than it would take
on the Z80. On the other hand the 6502 required on average less clock
cycli per instruction. However Z80 based systems usually run at a
significantly higher clock rate. This makes speed comparisions between
Z80 and 6502 based systems tricky; a 3.5 MHz Z80 isn't 3.5x as fast a 1
MHz 6502, it is generally believed that it is closer to 2x.

> So on the 65xx side you needed more support
> chips to do things that the cpu could not.

The Atari 2600 console (which uses a 6507), the CPU had very little
support from the support chips; every display line it had to continuosly
feed the "display chip" with new data, since the display chip wasn't
able to get the display from memory by itself (like the display chips in
most systems). So if speed isn't a concern a 6502 based system doesn't
necessarilly require more support chips than a Z80. If speed is a
concern, having support chips to offload the CPU always helps, even on a
Z80 based systems.

The Z80 did have feature that 6502 did not; the Z80 did have support for
DRAM refresh so it could be used with DRAM memory with minimal support
circuitry. On the C64 the video chip (VIC-II) is responsible for the
DRAM refresh

> For example on a 65xx would it be possible to drive the display as is
> done on the zx80 (not the ts1000 or zx81 which used a custom chip) and
> the cpu with only a few off the shelf logic chips?

The ZX80 to advantage of the DRAM refresh and some other Z80 specific
"features" to implement a very simple (but clever) display system. Some
aspects like executing a display file might be possible on a 6502 based
system, other aspects would require another solution.

On the other hand the 6502 had a feature that allowed display chips to
use the same memory as the CPU without slowing the CPU down (at least
most of the time). The 6502 accessed memory only one phase of the clock,
the other phase could be used by the display chip without the CPU
noticing it. Of course the display chip had to be specificly designed to
be matched with the 6502, which may explain why 6502 based system often
use custom designed chips, whereas many Z80 based systems used
of-the-shelf solutions.

Yeah, the seventies.

I know the Z80 for machine-code Arcade. Though its processing power
makes a good Home Computer. Low Budget, too.

>
> Later on when there wasn't a price premium for CPUs other than the
> 6502, the Z80 got used in all sorts of new budget computers.

You must be joking. The Z80 (and cousins with more MHz and special I/0
etc.) made the greatest turnover of all 8bit CPU's. Konami, SEGA,
ATARI, Capcom, STERN, Nintendo, Nichibutsu, and so much more ....

Don't say Sir Sinclair could know this all being, just out of
'Galaxians' - one of the first Z80 Games 1979 (3.072MHz, Sound Samples).
Maybe foreseen, but never known.

Just believe it. His choice to take a z80 was marvelous!

Well, the 68000 is a superb processor but already 32bit and not easy
for anyone but much more capable than i80386 and the rest of the
spaghetti-gang. The z80 is much easier, more effective (see industrial
integrations for the mighty Z80) and highly adaptable, due to
z80-design. Low Power Consumption, Silent, extendable, programmable and
so on.

Best Regards,

Daniel Mandic

Not at all; it has to do with market segment.

The z80 (slash 8080) was the cpu of choice for business
machines where things other than colour / missile graphics
were a priority.

The 6502 was suited for the home / hobbyist market -- its
low cost (a quarter of its competitors' cost when launched)
meant $ could be spent on things like colour, missile graphics /
sprites, sound, etc which were more of a priority for the
home.

The fact that the 65xx was cheaper than the z80 which allowed the

companies to spend more money on the graphics actually does show that
the cpu (the cost of it) did influence the display in a small way.

That could be something... But then again, the Sega Master System had
better color graphics capabilities than the NES, yet the SMS had a Z80
and the NES had (a rather fast) 6502 clone. So no, I don't think CPU
really influenced display type.

<snip>

There is something nobody has talked about yet. Possibly because it might not have made it out of Winnipeg. M$ made a CP/M card for the Apple//. It worked in my][+, sort of worked with my //e clone, and wouldn't work in my GS. It was intended to be a text only display using the Apple as a display unit. I think someone locally wrote a unit for Turbo Pascal which used the Apples memory to display HGR graphics. I took a look at the calls and figured out how the author did it. The M$ card had a special routine which allowed the programmer to directly access the Apples soft switches. The RAM wasn't on the CP/M card. The card just rearranged the available memory from the Apple and had a limited amount of RAM and I guess ROM to replace what was used by the Apple. The memory was allocated and the unit was a series of routines which built on the plot of a single point. It still displayed graphics in colour.

The whole process was slower than an Assembly program on the Apple, but faster than Applesoft.

Later
Mike

Try running the GS in 1 MHz mode.

There is a version of MBASIC that supports the graphics commands from
Applesoft. I've used it on real hardware (knockoff, not M$ brand).
Doesn't really work well on the //e because CP/M insists on running in
80-column mode.

-uso.

Given that time period I think you'll find the major reason being the cost of RAM (circa '78 16K was about $80, by '82 64K-128K could be had for the same price) and color monitors at the time. Combine that with the general publics attitude that home computers were just a fad and you can see the resistance a company would have designing a color system for general use in those early years.

Acorn Atom, I think.

>> Now there are exceptions to this, but it makes me wonder, did the CPU
>> influence the display?

> Usually the display was handled by a video processor.

True. But the *layout* of the display memory was certainly influenced by the CPU. The Spectrum's screen memory is laid out to take advantage of register pairing when writing character bitmaps (increment the high byte to get to the next line within a character cell), and Acorn's 8-bit machines (at least the BBC and Electron) used a layout such that each character cell used a contiguous chunk of memory (8, 16 or 32 bytes, depending on the number of colours).

The following code shows this (I'm ignoring calculation of screen addresses and, for the Spectrum, the writing of the attributes byte.)

```
     ; HL points at character bitmap data
     ; DE points at the first byte in a character cell
     LD   B,8
.copy
     LD   A,(HL)
     LD   (DE),A
     INC  HL
     INC  D
     DJNZ copy

     ; chr (zero page) points at character bitmap data
     ; scr (zero page) points at the first byte in a character cell
     LDY  #7
.copy
     LDA  (chr),Y
     STA  (scr),Y
     DEY
     BPL  copy
```

[snip]
>> Now it could have been display size, many Z80 computers used 80 columns

So did some 6502-based machines.

And a few had teletext modes...

[snip]
>> So the question is, did the cpu influence the display?

> The answer is still no.

The answer is yes.

Are You referring to me, Sergeant?

If so, I just have to consider the intelligence level of the person calling me stupid, then I feel vindicated...

Do you know what intrinsic value is, Sergeant?

Do you know what commodities are, Sergeant?

Do you have a brain, Sergeant?

Commodities never go to Zero value. Do you know why? It's because they have intrinsic value! What does that mean? It means that the demand for the goods exceeds the cost to produce them. Sugar, for example, has intrinsic value. There is real deman dor sugar so there will always be a market for sugar. It doesn't matter how much it costs to produce sugar, the market will always be there.

Do you want a really good example of intrinsic value? Look at the prices on the gas pumps the next time you fill up your tank. And when you do that, ask yourself what the intrinsic value of oil is?

Anyway, I'm not gonna sit here and explain simple concepts to simpletons that will never understand them. We can't all be born intelligent. :P

So, let me leave you with this snippet from a dream theatre tune:

"The unbroken spirit
Obscured and disquiet
Finds clearness this trial demands
And at the end of this day sighs an anxious relief
For the fortune lies still in his hands."

Yep, I'm good! I'm too good.

Ciao...

I just got an XF551 drive, and after pluging and unpluging the damn
thing a few times, the computer stopped recognizing the drive, unless I
put pressure on the plugs. I started looking for a solution on the net,
and I guess this is a very common problem... I wish I read that before
I was playing with the cables!

Anyway, I opened it up, and tried to reheat the contact points, but
it's no use - the traces started lifting off of the circuit board
already. I saw somebody suggest that you use thin wires and replace all
the connectors that way. Well, my question is - the drive that I have
has the two SIO ports connected already, pin by pin, by thin wires. Was
that how it came out of Atari, or did somebody already tried to fix it?

Thanks,

MrScout

It's interesting that you would include a link to canadiancoin.com, JR. Did you know that in the thirties, people would literally burn money for heat? The global depression of the time meant that some currencies around the world were virtually worthless. It was cheaper to literally burn the money than it was to buy heating oil. In some countries, coins were used as buttons on clothing because they had less value than real buttons.

Of course, todays money has no real value. It's all arbitrary valuations based on speculation and a host of variables too varied and irrational to even bother trying to contemplate. Although, your link kind of lends credibility to the concept I've presented. As you know, money has a face value, which remains constant, a market value to collectors, an entirely different value on international monetary markets, and... Well, I'm not going to spend much more time on this subject.

Gee, I wonder if I should tell Rick and the Sergeant about the old gold standard? I'm sure they'd probably delight in knowing that gold once had a fixed price and that it was used for determining the value of a nations currency. Money, it does a body good!

Yes, I was most definitely referring to you, YOU. I completely read
your lunatic fringe "logic" and can see that you not only need to
obtain several clues, but probably could use a shrink as well.

Hi all,

Tomorrow, I am going to put my last MIO on Ebay for a 3 day auction.
Bidding will start at $325 and a BUT IT NOW for $400. Here is the
specs:

1mb MIO Hard Drive, XE adapter and MIO diskette. I dont know if I have
another manual or not. I will look for one, but assume that I wont

find one.

I will also put 1 brand new MIO XE adapter that is still in its
plastic up for auction, 3 days, $50 start or $69 Buy It Now.

If anyone wishes to offer more, email me ASAP before I put it on
tomorrow. Shipping will be determined by address.

Thanks,
Rory

sorry the link didn't go to the page I intended. It was supposed to go
to a definition of the various types of 'value' that can be assigned to
a collectible object such as a coin (or an obsolete computer accessory)

Here is the text of that Definition from that site:

VALUE
     - A coin can have as many as five values depending on the context
in which they are used. Face Value is the denomination of the coin.
Intrinsic Value is the melt value of the coin's metallic content and for
gold or silver coins is greater than Face. Wholesale Value is what a
dealer will pay to own a piece for his business for eventual resale.
Retail Value is what a typical collector will pay to own the coin.
Esteemed Valued is the highest possible price that a collector might pay
for a piece and this price is influenced not just by how rare or
non-competitive the coin might be but also by a certain amount of "ego"
and emotion on the part of the buyer, Certain coins with "pedigree" may
also be classed here. See Pricing Rare Coins.

Reading some of the computer history books gives some insight into
that. It depended on the compnay, graphics chips back then were pretty
primitive either TTL logic or if there was sone hotshot designer in the
compnay maybe a chip. Though it took a hundred thousand (or more) to
design a custom chip.

Commodore had the in-house guys from MOS to do the work and developed
thier own chips, Atari had also lots of arcade machine experiece to get
their job done. Apple had color, but conparitively the Apple][
actually had a pretty primitive color system (it didn't greatly improve
until the 80 column board)

CP/M machines were mainly going for the business market and column
space was way more important than color (decent 80 column color
displays were VERY expensive back then) so it was an expense they
probably didn't want to risk putting to the consumer.

The only real spectactualr color 80 column computer then was the
CompuColor II and at something like $3,000 it was certainly one of the
most expensive as well.

It's just color was not a common technology and also it wasn't a cheap
technology to develop from scratch unless you really wanted it. Those
that had it cheap were the ones how did thier magic in-house and went
for mass market sales, those that were more expensive were probably
buying third party video chips at higher cost.

Larry

Ah that's too bad, Sarge. A shrink? Do you think I need a shrink? Why?
Do you want me to be as stupid as you are, Sarge?

Anyway, it's not fair of me to insult you for being ignorant. I suppose
things like intrinsic value, commodities, etc., hold little interest (no pun
intended) for most people. Although, it really is a very simple concept
and I thank JR for printing a more concise definition of intrinsic value.

In the future Sarge, you should read some textbooks from a high school or
something before you discount my ramblings as lunatic fringe logic. Cuz,
quite honestly, you sound like a fucking idiot.

I hope this doesn't get me added to anymore kill files! ;)

BTW: Have you ever noticed how some people have a tendency to tell you that
they're adding you to their kill file? Usually it's someone that wasn't
even part of the discussion. It's sort of like an ugly chick approaching
you out of the blue, and saying that she rejects you. I mean, who the hell
was interested in the ugly chick in the first place? I mean, you're adding
me to your kill list? Uh, yeah... Okay, but who the hell was talking to
you?

I gotta mansize predicament... Goes something like this...

Ever heard those words before? That's how the Kiss tune, Domino, begins.
If you're a Kiss fan, you know that Domino is a girl that's too young, but
she has a great bum. Apparently.

Anyway, that's not my predicament and I ain't got no girl that's too young.
I will admit however, that the Revenge CD was the first CD that I ever
bought. It's a pretty damned good CD too! Well, if you're a Kiss fan.

Personally, I grew up loving Ozzy Osbourne. Yep, Ozzy and Atari were my
bread and butter as a child. I ate, slept, and drank Ozzy tunes and Atari

Computers. Heck, I can't begin to recall all of the times that I would pop my Ultimate Sin cassette into the old Atari 1010 program recorder and have "Killer of Giants" pump through the speaker on my little black & white television. Those were the days! The glory days!

Those days, I hear, are long gone. Or are they? Personally, I think the best days are ahead. I've always believed in fighting fire with fire. I believe in kicking them when they're down... Oops, sorry! I meant my enemy believes in kicking them when they're down. But the enemy is usually loser!

Anyway, the enemy says that they have the numbers. I don't know what they're talking about! I think they're more than just a tad retarded. I think they're downright braindead!

Dear Enemy:

You don't have the numbers! People put there garbage out every Wednesday in this neighbourhood. That's not an army! That's just people putting their garbage out! Think about it!

Here's a link for ya Sargeant Silicon:

http://www.investorwords.com/2587/intrinsic_value.html

Here's the definition that you'll find at the above website:

"The actual value of a security, as opposed to its market price or book value. The intrinsic value includes other variables such as brand name, trademarks, and copyrights that are often dificult to calculate and sometimes not accurately reflected in the market price. One way to look at it is that the market capitalization is the price (i.e. what investors are willing to pay for the company) and intrinsic value is the value (i.e. what the company is really worth). Different investors use different techniques to calculate intrinsic value."

That is a direct quote! If you want to know what market capitalization is, it's the trading value of a share multiplied by the number of shares issued. Note that they are very clear to point out that what people are willing to pay for something is the "market value." The intrinsic value is the real value, or what something is actually worth!

Sorry, Sarge, it's not quite lunatic fringe material. The shit that you're spewing is closer to being lunatic fringe material. :P

There are many places on the Internet where you can find similar definitions for intrinsic value.

SO TRUE!!! I will only need to resolve this problem if I decided to try
4 MEGS!!! 1 MEG is rediculous, 4 meg is ludicrist! Why am I doing it???
just my life long hobby....ohh and because I CAN!!! I'll post some pics
and a schematic soon...

Ralph

Alfred:

> I would do it a bit differently, since I'm not much good with those
> carry bit tricks:

that was no trick ;) that was 16bit number with sign

```
       ldy #$00
        txa
        bpl plus1
        dey
plus1 ...
```

Y reg. will hold MSB so if X reg. is positive then we just add 0000-007f,
else we add FF80-FFFF (add with carry two bytes - not a trick).

Your code with for example 120 in X reg. MOD_max_x=159 cursor_x=150
mouse X position is legal within (0,159) and we moving +120
(positive value):

```
>         txa
>         clc
>         adc cursor_x
```

so we have 150+120 which is 14 cause we lost highest bit of 270

```
>         tay
>         txa
>         bmi _negativ   ; mx=negativ? yes -> _negativ
```

not executed because it is positive

```
>         cpy MOD_max_x
>         bcc _lesser_max
```

executed, 14 is lesser

```
>         ldy  MOD_max_x
> _lesser_max
>         sty cursor_X
>         rts
```

so we have 150+120 -> 14 - mouse jumped from right side of screen
to the left and should stay at max_x on the right side.

Sc0rpi0
I hated going to weddings.
All the grandmas would poke me saying "You're next".
They stopped that when I started doing it to them at funerals.

> C64 documentation. Is this a user mode (Using the CPU to change the
> attribute byte in 320x200 mode for instance) or is it a hardware mode?

What you are looking for is the FLI mode. You can find code for it at
http://www.ffd2.com/fridge/ and in one or more of the C= Hacking issues
(don't have an URL handy but Google should be able to find it).

The FLI mode is what you would call a "user mode", it is not an
officially documented "hardware mode".

Normally the VIC chip fetches the attribute bytes every 8th raster line
and caches them internally. Those rasterlines are called "badlines"
because unlike most other memory accesses by the VIC chip, these memory
accesses slowdown the CPU. Since the attributes are cached in the VIC
chip and only fetched once every eight lines changing the attributes
bytes halfway an attribute cell won't have any visible effect.

Fortunately the VIC chip can be fooled so it will fetch the attribute
bytes every rasterline by manulating the vertical scroll register so it
always thinks there is a "badline" condition. This trick requires cycle
exact timing. The CPU in the C64 isn't quick enough to copy 40 bytes of
attributes data during a badline, but it can change the memory location
of the attribute bytes by writing to a single VIC register. The FLI mode
requires a lot of CPU attention, while the raster beam is in an area
where a FLI image is displayed the CPU has very little time left to do
anything else. In case of a full screen FLI that would mean that on a
PAL system there is only 36% processing power left to do other things.
By restricting the FLI mode to a smaller part of the screen, more
processor cycles can be spend on other activities.

Corection: all text/graphics modes on the C64 support (more than two)
colors.

What you are saying may be true for the spectrum, but is not
necessarilly true in general. The memory layout of the bitmap modes on
the C64 is exactly the same as on the spectrum. The reason is according
to the article below is that way the same circuitry could be used for
character and bitmap modes:

Back in the day I built an external board with 2 MB of SRAM
with 256 X 1's and used it as a ramdisk. Very large and very
cumbersome, but worked great. Recently, I designed and have
produced a 4 MB ram board for the Apple IIgs and I am now
selling my 3rd run of 50 boards. It has 4 x 1 MB simms, and
I am now looking at designing an 8 MB board for them using
2 x 4 MB 72-pin simms. So, what I'm saying is, I understand
your need to do what you are doing.

You can check out all of the products at www.gse-reactive.com

I think you're wrong.

I believe the Spectrum display memory is arranged as it is to simplify the
hardware design and save silicon space inside the ULA. This has nothing at
all to do with taking advantage of register pairs and such like (That is

probably just a side effect of the design). Spectrum display memory is
arranged so that only one counter is needed to fetch both bitmap and
attribute with a simple 2-to-1 line decoder selecting which.

It's been fixed by a previous owner. At least some of the drives as they

came from Atari didn't even have the connectors bolted to the circuit
board. I think they started using rivets after the attachment problems
surfaced but the circuit board they used was about as fragile as a
saltine cracker so it didn't help much.

>

Your ding dong wasn't getting stuck in the PBI slot, it was telling you that you were missing the hole. It's bad enough that you're molesting machines, but you're molesting male ports? Damn! Stick with the female ports and slots!

Oh, and "ding dong" is so passe! Sounds too much like a doorbell. If you ask me, you want a sound effect that really drives home the whole hammer pounding experience... Might I suggest the "thump"? Yeah, the thump suggests that you probably finish with only one swing of the hammer, but you can't have everything... Right?

That is true! However, you're putting the buggy before the horse. The whole point of the exercise, from what I gather, is just to see if the 800 will even be able to recognize the one megabyte simm. It's sort of a solution in search of a problem... Although, the problem of having the 800 even recognize the simm is the most immediate challenge...

When you're doing something for no particular reason, there still exists an order of operations.

Order of operations? Get it? From math class? BEDMAS! Brackets, Exponents, Division/Multiplication, and finally, Addition & Subtraction.

Anyway, since Ralphy isn't doing this project to address any real problem, there's really little incentive to immediately seek an apparently nonexistent problem.

Now that I think about it, one megabyte of memory in an 8-bit computer would not really have much practical use. I'm sure ralphy recognizes this. That's probably why he's doing it just for the hell of it.

No, you really don't understand the concept of intrinsic value.

The MIO can be 100% replicated at very little cost with modern technology. Let's say that the MIO can be 100% replicated for a total cost of nine dollars. That would mean that the MIO has an intrinsic value of nine dollars. Why? Because the MIO cannot exist for less than nine dollars!

Think about it! It's not terribly difficult!

If an MIO can be manufactured for nine dollars and someone is willing to pay fifty dollars for it, does that mean that the MIO has an intrinsic value of fifty dollars? Absolutely not! The intrinsic value remains nine dollars! Nine dollars is it's real value!

Fifty dollars is an arbitrary value with absolutely nothing to support its imaginary existence. Why is the MIO worth fifty dollars? It's not! It's worth nine dollars! Why? Because that's how much it costs to produce one! You cannot produce one for less than nine dollars!

Let's say that a vendor produces MIOs for nine dollars and sells them for three dollars... In this particular case, what is the intrinsic value of the MIO? Well, the intrinsic value is still nine dollars! Yes, even if you're buying them for three dollars! The logic works the same in both directions!

Oh, and don't even bother trying to mix sentimentality with intrinsic value. Intrinsic means real! Sentimentaility is irrational and stupid! Anybody that confuses intrinsic value with sentimental value, is one of those people that P. T. Barnum accused of being born every minute.

Do you know what the word "context" means, Mr. Cortez? I've taken nothing out of context! You're just not quite getting it! Uh, huh...

No you really look up intrinsic in the dictionary. You have no idea what
it actually means. Not to subtle of a hint: It doesn't necessarily have
anything to do with money or monetary value like you are trying to
characterize it. Belief in Jesus is intrinsic to a Catholic for example.

Okay, here's the definition of "intrinsic" as taken from dictionary.com:

in**?**trin**?**sic (P) Pronunciation Key (n-trnzk, -sk)
adj.

1. Of or relating to the essential nature of a thing; inherent.
2. Anatomy. Situated within or belonging solely to the organ or body part on which it acts. Used of certain nerves and muscles.

Let's remember that it was *you* that introduced the word intrinsic to this discussion.

Let's start by determining which of these two definitions is applicable to the use of "intrinsic", for purposes of this discussion. Clearly, we're not talking about anatomy or anything organic, so we must be talking about the essential nature of something. In this particular case, we are talking about the essential value, or the "real" value of something. We are talking about the "Inherent" value of a good or service.

For purposes of this particular discussion, the product we are talking about is the old ICD Multi-Input/Output device. What is the inherent value of the MIO? What does "inherent" mean? It means real! The real value, in terms of an arbitrary valuation system like dollars and cents, is the minimum cost that the product can be produced for. In essence, the inherent value is the tangible cost to create something.

An MIO has real value because it must be created. It is manmade! It costs money to make something! The total cost involved in making an MIO is its inherent value. Its inherent value is its intrinsic value.

If something sells for less than its manufacturing cost, then it is not feasible to continue producing that good. Why? Because the real cost or value of the good cannot be recovered!

If the item can be sold for an amount greater than its intrinsic value, the intrinsic value does not rise. The intrinsic value remains constant.

So, what would cause the intrinsic value to change? Increased production costs would cause the intrinsic value to rise. Likewise, decreased production costs would cause the intrinsic value to change. It's a really simple concept that you are obviously never going to understand.

As for equating intrinsic value with cost... Sorry, Bud, but you were the one that initially suggested that the MIO has a higher intrinsic value to collectors... It was you that suggested that the MIO's intrinsic value is measured in dollars!

Read your own posts, dude. You're way out of your element on this one.

>>
>> The MIO can be 100% replicated at very little cost with modern technology.
>> Let's say that the MIO can be 100% replicated for a total cost of nine

>> dollars. That would mean that the MIO has an intrinsic value of nine
>> dollars. Why? Because the MIO cannot exist for less than nine dollars!
>>
>> Think about it! It's not terribly difficult!
>>
>> If an MIO can be manufactured for nine dollars and someone is willing to pay

Basically would make a good ram disk. Back in the day I had a 130xe
with a ramdisk and later a 800xl expanded to 256k with a ramdisk wich
I used for a bbs. There were people with 1meg ramdisks back then and
altho nowadays I dont see much point in it, if I could upgrade my 65xe
to 1meg with a simm I would do it just because I could (plus I have
about 2 ziplock bags filled about 100 simms of all different shapes
and size)

If you really really think about it. There is no point in doing
anything on an 8bit! I mean it's fun and I am not knocking the hobby
but the 8bits have been pretty well emulated on the PC and other
platforms, and even if you have a 8bit computer you can emulate almost
any device with an SIO. So really the whole retro hobby is sort of
pointless and YET we still do it. So why not a 1meg Atari 800?

That is largely a matter of taste. A lot of people found the supermodel
Twiggy attractive. Personally, I saw her as sort of ugly.

Although I think the later C64c was better looking, I think the
breadbox C64 also looked OK.

I think I'm beginning to understand what BogoMIP's are. Someone shortened
Bogus MIP's to BoguMIP's, but made a typo and it became BogoMIP's.

Yes, it is a useless measure.

That's what the Bogo stands for ;-)

Although it's an interesting exercise I think the people who pointed
out bogomips would be a good benchmark where taking the piss, the
spectrum will make the c64 look like a pocket calculator using cpu

benchmarks.

That said the spectrum still rules and you knows it :-P

Merry Chirstmas, all (-;

I was just wondering why Atari decided to have a disk loading sound. Or is
it because the POKEY handels disk access as well as sound output?

Secondly - I can only speak of PAL systems, though - even when those sounds
are muted by setting $41 (dec. 65) to 0 they are still audible, at least
with all the TV sets and monitors I've used my Ataris with.

On with the holidays, ho-ho-ho,

Frank

No you frigging idiot. One more time: I said the *NEW* stuff had no intrinsic value to a collector. New stuff being the IDE interfaces for instance.

Get it yet? Collector of old stuff, paid fortune for MIO. I say the new stuff has no intrinsic value to him because he is a collector of old stuff? New stuff is not "Of or relating to the essential nature of a thing; inherent" of a collector of old hardware?

I am convinced you are just trolling. No one can really be that dense. I posted before about how idiot trolls in this newsgroup tend to limit my participation because of their hysterical rants and accusations. Thank you for popping up to demonstrate.

What level of education do you have, Rick? I'm guessing that you're probably in your fourties, that you grew up in the mountains, you graduated school in grade four, and moved on to oversee the family beetle breeding business. I'm guessing that you live from paycheque to paycheque because you don't understand simple concepts like value. You get ripped off at almost every turn and you believe every word that you read in comic books.

Yes, you, Mr. Cortese, you are a total fucking idiot!

Oh, by the way, your participation is limited because you're a total fucking moron that seems utterly incapable of separating cranium from rectum, let alone fact from fiction, or intelligence from ignorance. You're a nothing, Mr. Cortese! You're a nobody! You will always be a nothing. You will always be a nobody! You are a pathetic loser that does not have any understanding of the world around you.

Being labelled a "friggin' idiot" by you, Mr. Cortese, is tantamount to being knighted by the Queen for intelligence... Being labelled a "friggin' idiot" by you, Mr. Cortese, is tantamount to winning the Nobel Prize! Do you know why? Because people like you are worthless insignificant peons. Your tiny little cranium isn't capable of understanding complicated concepts like tying a shoe, for example.

Ha! Being labelled an idiot by you? Oh, I guess I'm supposed to feel bad now because a fucking moron can't understand a simple concept... A concept, I might add, that is taught in almost every high school, business school, and street corner on the planet. You're calling me an idiot?

Fuck off and die you disgusting piece of shit!

So we don't totally disagree; I think the 64c was a much better looking machine than the 64. ;) As for the supermodel Twiggy, I have no idea who he/she is... I'm guessing that my ignorance of this "supermodel" is largely due to the fact that she *is*, as you say, sort of ugly. Of course, this is just conjecture on my part.

I also agree that perceptions of what is attarctive or unattractive is, entirely subjective.

So what does it all boil down to? Choices! It's really all about

choices... and that, in essence, is what makes the C64, Atari8, TRS80, etcetera, etcetera, so attractive as a whole. We are not forced to use computers that we think are ugly; I chose an Atari8 because I thought the C64 was ugly.

How fitting that I should be talking about choices at such a time in Canadian history. We are currently in the middle of a federal election campaign here in Canada. Elections, as you know, are all about choices. We, as a people, insist on having choices. Sometimes we can be satisfied with just one alternative, and sometimes we need several alternatives.

I choose... Those are probably my two favourite words. I choose! As a kid I used those words quite frequently. My parents attempted to put me in boy scouts, and I chose otherwise. Growing up, many people insisted that I needed a girlfriend, but I chose otherwise.

I choose... Yes, the Commodore 64 was vastly more popular in this neck of the woods, but I chose otherwise. I chose the Atari 800XL. No one is ever going to convince that I made the wrong choice. No one is ever going to convince me that I should regret my choice.

It's election time in Canada, and I'm, once again, ready to choose!

I don't have any 1200XL's kicking around, but I hear that they may have an intrinsic value of $2000 to a collector. I hear that the newer computers have absolutely *no* intrinsic value... but hey, what do I know... I'm a friggin' idiot!

Ooops, looks like I just slit my own throat on that one!   I admitted that I don't own any 1200XL computers.   Gee, I guess that makes me a friggin' idiot and a troll!   I guess I'm not a real Atarian because I only own 4 800XL's!

Hmmm, I wonder what the intrinsic value of my 800XL's would be to to a collector? $17,000 dollars each... Going once, going twice... Sold to the idiot with zero understanding of value!

I don't know too much about the Apple II. I've owned a few Apple II Pluses,
but I've never really played with them or done any serious tinkering.   I

totally agree with you on the idea that seemingly impossible things are possible, when the will to achieve is present and strong.

But then again, sometimes appearances are deceiving and the seemingly impossible are all too probable. Again, the Apple II is a good example. What may have seemed impossible (lowercase characters) became very probable. And eventually, lowercase was shipped as standard. :)

Merry Christmas to you as well.

> Merry Chirstmas, all (-;
>
>
> I was just wondering why Atari decided to have a disk loading sound. Or is
> it because the POKEY handels disk access as well as sound output?

It is to a major degree due to the latter. The sound output is to a good
degree caused because the pokey sound registers are used to setup the
timing base for serial I/O, but read below.

> Secondly - I can only speak of PAL systems, though - even when those sounds
> are muted by setting $41 (dec. 65) to 0 they are still audible, at least
> with all the TV sets and monitors I've used my Ataris with.

This is because the serial line is also wired to the sound output. You
can cut this line, and then won't be able to hear the sound when it's muted.

So long,
     Thomas

Atari, definitely. Just make sure it comes with "SCRAM" on disk or
tape.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

My first computer was and is a 1200XL which still works, actually. We

bought it in 1983 for $300 since no one wanted them. It has an
excellent keyboard though the contacts need to be refreshed.

I got another working 1200XL at the swap meet about 10 years ago for
$10. Still works. I'll part with it, tearfully, for $2000... ^_~

It is about the same for me except I bought the older Atari 400 model. There
were the good old days. I really miss them.

Nice picture. <g>

>Today it is 22 years and two days, since I bought my first Atari
>computer, the 600XL model.

I bought my Atari 400 back in 1982. Those were the best days for owning a
computer. I miss them greatly.

I bought my Atari 400 about the same time (a bit earlier). I really miss those
days. I had the most fun.

I am not sure why, but I am glad it is there. I suppose it was to let the user
know the disk is loading. I use an atari disk drive emulator with my Atari 32-
bit clone (Hades060) and when the disk image loads, I get the same sound. Kind
of neat I think.

Dear Mr. Wichhurst,

My advice is that you should turn to the Acorn Group in Cambridge, England, with a requirement specification and reference documentation for the specific nuclear power plant you are planning on building. I am quite sure they can offer a customized hardware solution for your particular purposes.

Or, since you seem to have deep knowledge of computing and electronics, you could go to your local computer dealer and buy a brand new Acorn Atom computer off shelf and write the power plant control software yourself. Preferrably in machine code then, to be able to make all your software logic and data fit in the 2048 bytes of on-board RAM memory.

Best regards,
Anders Skelander

Merry Christmas to you too. Happy new year! Skor!

I can't remember when, not to the day anyway, when I bought first
Atari. It was an 800 puchased in 1979, October/November, I think. It
still works.

Funny, I never did get to see a real 600XL. I think I've seen all the
other US models but not the 600XL.

You are looking at this matter from a purely UK perspective. And please

don't pretend that all of Europe was the same as the UK.

From a worldwide[1] perspective, the Commodore 64 still ruled the 8-bit era.
The Spectrum was only a minor league player.

[1] worldwide includes such far off places as Australia, Japan, etc. We do
not need to include Antarctica as very few penguins used computers.

If you want a technical comparison, here you go:

C64:

64k of memory
16 colors
160x200 and 320x200 graphics
8 multicolor sprites
3-voice synthesizer chip
Disk drive has built-in DOS
ROM BASIC
BASIC has no sound or graphics commands

Atari 8-bit:

128 colors(early models), or 256 colors
Between 16k and 64K of memory depending on model
Several graphics modes
4 monocolor sprites
4-voice sound(simple tone generator, not a synthesizer chip like the C64 has)
Disk drive requires a DOS disk
BASIC is either in ROM or on a cartridge, depending on model
BASIC does have sound and graphics commands

I still have many ATARI 800 XL carts, multiple copies of most of the games, all new and boxed, NTSC versions.

Ca. 100 copies of One on One, could be used for homebrew projects.

Also many copies of Ballblazer left.

Payment is possible with paypal :

LIST :

ATARI 800 XL/XE Carts :

3.00 * Ballblazer
3.00 * Crossbow (Lightgun)
3.00 * Hardball
2.00 * One on One
3.00 Final Legacy
4.00 Star Raiders 2
3.00 * Thunderfox
3.00 Pole Position
3.00 David's Midnight Magic
3.00 Desert Falcon

XL carts

3.00 * Tennis

XL Disk (48K)

3.00 * Mickey in the Great Outdoors

Hardware :

Sears Video Arcade II PaddleJoystick Combo 1.- (ca. 100 - 150)

Telegames Paddles 2.- (not working 100%, new and boxed, but need to be fixed, usually fire button automatically working)

CX-30 Paddles - 6 Euro

Shipping :

-5Kg :

6 Euros Germany
17 Euros Europe (EU)
30 Euros Europe (rest)
32 Euros USA, North America

37 Euros rest of the world

-10Kg :

8 Euros Germany
22 Euros Europe (EU)
35 Euros Europe (rest)
42 Euros USA, North America
52 Euros rest of the world

-20Kg :

10 Euros Germany
32 Euros Europe (EU)
45 Euros Europe (rest)
62 Euros USA, North America
82 Euros rest of the world

-31.5Kg :

12 Euros Germany only

Discounts are possible for large qts.

Please note : Because of taxial reasons, payment cannot be made before
1/1/2006.

> really interested in solid technical discussion...

i've not seen an article that goes into major detail, but i've programmed a little on the Atari and have a good working knowledge of hte C64 so have considered writing one - i'll try to answer your questions...

The C64's hardware sprites are easier to maintain, Atari players are one byte wide and 256 or 128 high and the vertical position is set by writing into a page/half page of RAM at the appropriate point; that means that moving a 16 pixel high object one pixel vertically requires (to do it cleanly, cheating is of course possible) the clearing and then writing of 16 bytes of data compared to a single register write on the C64. The C64's horizontal system is a little more fiddly with the MSB but that's because it has a higher horizontal resolution and, of course, there are eight hardware sprites with up to three colours each (two shared, one individual) compared to four single colour players and four missiles or five players if the missiles work together and nothing to stop either machine recycling the sprites as the scan passes down the screen.

> In particular, I'm interested in doing graphically oriented demos and
> games. Atari is great with it's 128 colors, but I've read that you can
> duplicate it on the C64 with special effects.

About 120 colours have been "faked" using a couple of tricks but to be honest i tend to not do much more than interlaced sprite colours myself; that gives about 24 colours in total and the interlace isn't enough to burn a gamer's retinas out! =-)

The C64 scores over the Atari in one fairly important respect, it can handle all 16 of it's colours on a scanline with no effort; 160x192 on the Atari is 5 colours a line before the players get involved, the equivalent 160x200 on the C64 is 16 a line before the sprites are involved. Similarly, 320x192 on the Atari can only manage two shades of one colour before the players step in whilst the C64's 320x200 is again 16 colours. Both machines have hardware horizontal and vertical scrolling and, whilst the Atari has nice features to manage scrolling maps and the C64 can only smooth scroll by 8 pixels before either moving the data the "long" way or using tricks like VSP or AGSP to shift things, it does have a better horizontal resolution.

> So, I would be interested to know how well/accurately/densly can
 > you control changes to the screen data mid-line, during V blank, etc.

Both machines have to perform data fetches on new lines, so there's

limitations to how much you can play with what's going on during a scanline but it's possible to dynamically alter the display list on the Atari to do all manner of things on a line-by-line basis. The C64 can do similar, but it's usually done with $d011 tricks and cycle counting.

> Is the DLI programming style, which seems very different from a
 > straightforward C64 way (well, except in the way you have to address
 > the individual pictures), better in the end?

Better? Well, yes and no; from a beginners point of view the DLI is an easier system to pick up because things like screen splits are handled by the display list itself, hardware smooth scroll is dead easy to work with and a quick STA WSYNC gets the machine roughly lined up with the start of the next scanline, but anything more complex is pretty much a matter of cycle counting like it would be on the C64 anyway and anything that needs more than two three colour objects per scanline is wandering off into software sprite territory (one character set on the Atari has 128 characters, compared to 256 on the C64) so it's swings and roundabouts.

 > And how about interupt programming in general? Which machine has more
 > usable posibilites?

Both about the same really, either the display list or the raster register trips the IRQ so the C64 just needs a little maintainance for certain jobs like mode splits.

 From a demo coding point of view, the Atari is more the undiscovered country; the C64 has been mapped pretty much to the cycle by emulator programmers (the two main C64 emulators, VICE and CCS, are highly accurate) so there's less new stuff to prod around with. As far as games go, both machines have an impressive back catalogue but for ease of knocking a scroller out and shoving eight sprites over the C64 is the easier machine to develop for to start with at least.

(Please note; posting at 1.40am so if this waffles or fails to make sense i apologise in advance! =-)

    Do the disks have a very 'scrachy' sound when they are inserted? Do any
  error codes display on the Indus while trying to read disks?

I fail to see how a Linux/Windows debate fits the thread topic, and I
certainly don't see why it's on comp,sys.atari.8bit. If you want to
debate the relative merits of Linux and Windows, you should go to one or
more of the Linux or Windows advocacy groups. You'll find plenty of
people there more than ready to join in.

And for the record, I use Mandriva Linux, Windows 98SE, an Atari STe,
and a 130XE. The one I choose to run depends on what I want to do. I
really don't care what other people think I *ought* to use, and I don't
care what other people want to use.

The ones who disagree with my choices are just wrong, that's all.
Nothing to get worked up about.

TJ

Yeah, I get you there. What threw me for a loop was the way you worded it. I
took that to mean "type in command on linux shell, get output on atari."
That is most excellent.

Hmmm... would ssh fall under non-interactive? I think it would blow my
friends' minds to tell them I can (indirectly) connect to their box with a
25 year old computer. :)

Now, one further question and I promise I'll shut up about it. :) What about
a "save state" feature? As I mentioned before, I am piecing together a box
just to run Atariserver, and I intend for this box to run Atariserver and
SSHD *only*. What're the chances of being able to just fire up the box, have
a cron job start atariserver immediately after boot, and when it loads, it
already has the last set of disk images from my last session loaded?

This box is going to be deaf and dumb. No sound, no video (once I get linux

installed of course), no nothing. I want it to be able to just power it up, wait 45 seconds or so, and then boot the atari. Being able to send shell commands from the atari to the linux box will be even better for this purpose, as I will be able to shut it down without having to use a 3rd machine to SSH in with.

Sorry for the top-post, but where are you guys getting figures of 128 and 256 colors?
The Atari really only has 16 colors. Or in another graphics mode you can get 16 shades
of grey. You can sort of make it look like it has 256 colors, but that requires alternating graphics modes on every other line. A line of 16 colors, followed by a line of 16 shades of grey.... can make it look like it has 256 colors, but it really doesn't. Plus, that cuts your vertical resolution in half. It does look nice
though.

Although I have no experience with the C64, I think the Atari is better graphics-wise.
The display list manipulation that you can do is awesome. I was aghast when I first
tried an IBMPC and realized how lame the graphics were compared to Atari 800. 4-color
CGA?... blah!

I think the sprites on the C64 might be easier to use than Player Missiles on the Atari
however. I didn't like the fact that to move them in one direction you actually have
to copy the memory around (if I remember right). To move them in the other direction,
you just had to change one value. I forget which way was which, but I think the horizontal direction was the easier of the two.

Jason, thanks a ton, this is exactly a comparison I was looking for. A couple additions questions if you don't mind:

- You mentioned that Atari is incapable of displaying more than two shades of one color on one scan line in hi res, or 5 colors in mid res. Is that because you cannot change the color registers fast enough, or because you cannot sync the change in the color registers precisely? As far as I understand the C64, you can have two colors in each 8x8 region, right?

- As far as speed of the machine is concerned, C64 is at 1MHz, and in low intensity situations there is one "bad" line every eight scan lines. The Atari's CPU on the other hand gets interupted by ANTIC on every scan line, but the CPU goes at 1.7MHz so I would assume that it still means you have more clock cycles available on the Atari to do stuff during the H and V blanks, right?

Ken,

My understanding on the Atari colors is that there are 16 colors, each
with 8 intensities, except for one mode on GTIA machines which allows
you to show 16 intensities of one color. You can display all of them at
80x192. So, it's not simply a matter of selecting colors for the hi-res
modes out of 256 colors, right?

I've always thought that the 800 had a mode similar to Amiga's HAM, but
from what I've read so far, it doesn't seem so.

Anyway, I've downloaded quite a number of books on both computers, I'll
be doing some good reading in the next couple of weeks while I'm off
from work, and I have a New Year's resolution to pick the computer by
then :)

Ah yes, you're right. But you can't get them all on the screen at once.

Sorry, ssh is an interactive program. With "interactive" I mean all
programs that require keyboard input after startup. ssh requires
that you enter the password/passphrase, the most you could do would
be to use "ssh host command..." and setup ssh access to a remote machine so
that you don't need to enter a password (eg. with RSA authentications
and have a RSA key without a passphrase). You could then run a program
on a remote host, but I don't think that's exactly what you want.

> Now, one further question and I promise I'll shut up about it. :) What about
> a "save state" feature?

Nice idea! I've been thinking about a similar feature (quick access to

several default configurations) for quite a while now, and I think I
know now of a way how to integrate this feature into atariserver.

Could take some time, though. The design of atariserver has grown during
the last months/years and I'll have to rework some parts of it. Maybe
I find some time after christmas or so.

> As I mentioned before, I am piecing together a box

> already has the last set of disk images from my last session loaded?

Actually I wouldn't use cron, but setup the box so that a user is
automatically logged in and have "atariserver" in his .bash_profile.
I use a similar approach for a PC running freevo (a media center
software for linux).

Create a user "atari" (for example) and add the following line to
/etc/inittab:
a5:2:respawn:/sbin/mingetty --autologin atari tty1

This will automatically log in the user "atari" on the first console if
the box is in runlevel 2. To do maintenance (without auto-login), just
run the box in a different runlevel (for example 3).

Create a .bash_profile in the home directory of the "atari" user an
set it up like this:

```
case "`tty`" in
    /dev/tty1)
        atariserver
esac
```

This will automatically start atariserver, but only if the user is
logged in on the first VT (so you can also do maintenance via ssh
or other VTs).

> commands from the atari to the linux box will be even better for this
> purpose, as I will be able to shut it down without having to use a 3rd
> machine to SSH in with.

Shutting down the linux box with the remote control feature of
atariserver (send "sh shutdown" from your Atari) should work if you
add the username "atari" to /etc/shutdown.allow

Yet another possibility: Install acpid on your linux box (and add
ACPI support to your kernel). If you then press the power button
the system will perform a clean shutdown.

so long,

Hias

> Is that because you cannot change the color registers fast enough, or
> because you cannot sync the change in the color registers precisely?

It's not incapable, i was only referring to "stock" without any CPU
overhead; it's possible to split the colour registers and other details
during a scanline, although it's a bitch to do well and the fetches for the
screen get in the way in the same way that the badlines do on the C64.

Generally speaking, pictures tend to be enhanced using player underlays and
line-by-line colour splits rather than mid-line splits.

> As far as I understand the C64, you can have two colors in each 8x8
> region, right?

Depends on mode, these are just the stock ones;

```
Hi-res char           1 fixed background colour, 1 colour per 8x8 cell
Hi-res char and ECM   4 fixed background colours, 1 colour per 8x8 cell
Hi-res bitmap         2 colours per 8x8 cell

Multicolour char      1 background and two shared, 1 colour per 4x8 cell
Multicolour bitmap    1 background and 3 colours per 4x8 cell
```

ECM is Extended Colour Mode, it gives a 64 character set with any colour you
like in each attribute cell and the upper two bits of the character byte
specify which one of four background colours that cell has.

> - As far as speed of the machine is concerned, C64 is at 1MHz, and in

> still means you have more clock cycles available on the Atari to do
> stuff during the H and V blanks, right?

The time lost to the ANTIC is variable depending on screen dimensions and
mode whilst the VIC-II's overheads are fixed but generally speaking yes, the
overall CPU speed is higher. Both machines are marginally faster when
they're not having to deal with screen data, for example during the upper
and lower borders.

there are a few different modes similar to the Amiga's HAM or HAM-E
one is called RIP.   Someone else can prob eleborate more.

Ken Swanson wrote:
> Ah yes, you're right. But you can't get them all on the screen at once.

Yes you can, the colour registers are all seven or eight bits depending on
mode. Without CPU load, the hardware can do five colours a *scanline*
without trickery or sixteen shades of one colour (any colour, not just grey)
in the 80x192 pixel mode but there's nothing to stop the colours being split
on a scanline-by scanline basis or finer than that if the programmer's good.

If the base colour on the 16 shade mode is split once a scanline it can
display all 256 colours in a 16 scanline high area easily.

Hah, you think?
The zx spectrum's edge connector made it ideal for robotics.
And yes, there were radio comms programs for the spectrum.
zxRitty (I think it was called) being one of them.
Why would the spectrum be unsuitable for ham radio data transmission?
It has audio tape as its default storage medium, seems ideally suited to me.

I would do it a bit differently, since I'm not much good with those
carry bit tricks:

```
        txa
        clc
        adc cursor_x
        tay
        txa
        bmi _negativ   ; mx=negativ? yes -> _negativ
        cpy MOD_max_x
        bcc _lesser_max
        ldy  MOD_max_x
_lesser_max
        sty cursor_X
        rts

_negativ
        tya
        bpl _lesser_max
        ldy #0
        beq _lesser_max
```

Not exactly. Despite the fact that the CPU in a C64 runs at 1 MHz, the
bus of the C64 runs at 2 MHz which means that most DMA cycles do not
stop the CPU. This is different on Atari where the bitmap DMA usually
takes every second cycle in display area and also DRAM refreshes etc
cost the cpu some cycles.

Regards.

Unheard of unlike the C64 and other systems which were popular among radio operators. Sure it is possible, but I don't know of anyone who actually used a ZX for that purpose.

It proves that the Spectrum was more than capable of the task.

How many times have you actually used a Spectrum? how much research have you actually done? Because everything you write points to a man who has no idea what they are talking about.

Oh, and still waiting for the answers to the questions I set you. Why are you avoiding all requests to those questions?

The both failed at the exact same time?

I would tend to think its a connection problem. Check both your SIO
cables with each drive, one at a time, configured as drive 1 of course.

Do you have an SIO2PC cable of the like or any other SIO attached
device which you could use to confirm that the SIO port is still
working?

A bad disk could "gum up" the heads of both drives but the drives would
not be quiet as you say they are. You would hear excessive head
seeking. (I think Steve Tucker was talking about this).

Head cleaning disks used to be cheap, like $2 USD but they are hard to
find now. The fiberglass one were more expensive but tended to last a
very long time. (Mine's about 20 years old). Don't even know if the
internet specialty stores carry 5.25 cleaning disks.

I doubt if the the experts ever reccommended cleaning disks anyway,
prefering to clean the heads with solvents and swabs instead.

Well, that's my 2 cents worth.

- Steve Sheppard

Clockmeister <no-one@nowhere.com> did eloquently scribble:
> The default storage medium was tape for virtualy all the 8 bitters, that in
> itself proves nothing.

I did say AUDIO...
Not all machines stored to tape using audio, did they?
If so, why did the commode require an expensive proprietory tape recorder to
save stuff (if you didn't want to take out the second mortgage required to
buy the disk drive)

Display list interrupts are not hard to do but from a practical stand point it is just a pissing contest to say how many colors you have.

Most games were written using Gr. 12 or 13 IIRC, whatever the 5 color ~text type mode with a redefined character set. This gave effectively the same resolution as Gr. 15 with an extra color. The advantages were they only took up ~960 <or 480 for the lower res> bytes to do a complete screen and modification took much less effort. These modes were available to machine language programmers from the early days and BASIC from the XLs.

Just for an example, I did a short 3d type dungeon with animated torches. All that was necessary to make the torches flicker was to change the two byte pointer character set pointer to a second character set with a redefined torch. Point being if I had wanted to animate dozens of things on screen like the torches it would not have taken any more over head, just additional redefined items in the 2nd character set.

But even with simple and slow techniques, like only having one character set with two torch definitions in it, it would have only required two bytes be alternatively poked into screen memory to animate the torch. Very fast compared to any high color or high res bit map mode.

The Atari is super cool, with at least one or two features that none of the other 8-bit machines can match.

But. the original Atari 400/800 computer models were released in 1978 (1979?) and thanks to the very advanced architecture seen from a late 1970s perspective, the 8-bit Atari could compete with some competitor models released 2-4 years later.

My conclusion is that the Atari cannot match the specification and the enormous game library for the C64, but there are a few things that the Atari can do that to my knowledge no other 8-bit computer can do.

It could be argued that the Atari 800XL model was a bit obsolete for its release date, but it also gave us all a glimpse of what the future would bring, with some of its exceptional 256 colour images and shining metal effects.

If you have not already done it, I think you should take a look at some top rated game titles and perhaps a couple of demos for the Atari.

Anders

When my work and the world was hit hard by the "I Love You" virus, I disconnected my PC for a day at work and brought in a Atari ST. I was able to dial into the network, and that was no problem. Getting a word processor that was in par with what was being sent at me was a fun part. And the list just went on and on.

I discovered that no matter how much I did like the Atari platforms, and maybe not as much the windows platforms, well, it was not a bad OS to use at work and then leave at work. :D

Don't own a windows PC at work. I like Atari and Macs. But the Windows platforms have their place.

There was a C=64 demo that that C=64 friend told me about in the 80's. And I have a pinball game for the Atari computer that I saved because it made fun of a guy on the BBS's. I might have that around. Interested?

Well, I've been doing a lot of research today, and I think I got a
better understanding of the speed difference between the two machines.
The comparison below is between both machines in the default text mode,
no sprites or anything else that would steal more cycles away, and in
NTSC:

C64: every 8th scan line VIC II halts the 6502 to fetch color and data,
and every line for memory refresh. So, we got:

65 cycles/scan line x 263 lines/frame = 17,095 cycles/frame
LESS
40 cycles/line x 32 bad lines
3 cycles/line x 263 for memory refresh

EQUALS
15,026 cycles/frame available

Atari: every line 9 cycles for memory refresh, plus 1 for each byte of
char fetched, one every 8th scan line for char set data plus display
list itself. So, we got:

114 cycles/line x 262 lines/frame = 29,868 cycles/frame
LESS
9 cycles/line x 262 lines
40 chars x 8 bytes x 24 lines
40 chars x 24 lines
EQUALS
18,870 cycles/frame available

I'm assuming that as the graphics get more complex, the Atari will
start stealing even more cycles than the C64, so the difference will
get smaller.

Anyway, even though the speed advantage is a lot less than the Mhz
difference would suggest, it's still a pretty good margin.

If I made any errors, or if there is more to the picture, please
correct me!!

there is 312 lines per screen on the pal systems that are most common.
In any case, your numbers don't add up for either PAL or NTSC systems -
there is 63 available cycles after memory refresh for PAL, and 65 cycles
after memory refresh for NTSC - or 64 on the rev0 NTSC vic. Your
numbers fail it.

Additionally there is onyl 25 bad lines per screen - one per displayed
charline.

63 cycles/line x 263 lines/frame = 19656 cycles/frame
LESS
40 cycles/line x 25 badlines/frame = 1000 cycles/frame
EQUALS
18656 cycles/frame available with the screen enabled.

> 114 cycles/line x 262 lines/frame = 29,868 cycles/frame
> LESS
> 9 cycles/line x 262 lines
> 40 chars x 8 bytes x 24 lines
> 40 chars x 24 lines
> EQUALS
> 18,870 cycles/frame available

Which is remarkably close to this figure, although I am reluctant to
believe your atari figures either, given how badly you butchered the c64
figures.

BTW, for NTSC:

65 cylces/scanline x 263 cycles/frame = 17095 cycles/frame
LESS
40 cycles/badline x 25 badliens = 1000 cycle/frame
EQUALS
16095 cycles/frame avaialble on NTSC, however it should be noted that
there are 60 of these per second - allowing for a total of 965,700
cycles/second available there, vs. 932,800 cylces/frame avaialble on
PAL.

Don't defend him!

I'm still waiting for answers to my questions I posed to him a while ago, and he
chooses to ignore, simply because he doesn't want to show himself up as the
fool.

,
> and every line for memory refresh. So, we got:

Exactly. You can also force the C64 to fetch color data more than that
so you get 1 pixel high color cells. This is called "FLI" in C64 world
and produces very high color resolution.

> 65 cycles/scan line x 263 lines/frame =3D 17,095 cycles/frame

65x263 on NTSC, 63x312 on PAL

> 40 cycles/line x 32 bad lines

The BA (bus allocate) of the processor is set 3 cycles before a DMA
operation starts, it will stop the cpu on memory read operations. This
means, depending on what is currently executed a bad line takes
41-43 cpu cycles. Also, there are not 32 badlines but 25, because the
C64 has 40x25 color cells/characters.

> 3 cycles/line x 263 for memory refresh

Nopes, there are 5 cycles per line DRAM refresh, but those are hidden
in the DMA cycles.

Another thing which is propably worth to mention: A C128 is fully C64
compatible, but has a flag to force all DMA cycles to be used by
the CPU which results in a 2 MHz mode. You can use this 2 MHz mode
in border areas which results in ~ 1.3 MHz effectively.

Regards.

Listen, can you guys please take this OFF the comps.sys.atari.8bit
newsgroup? It really has no business here. I for one, love my Atari 8bit
but am not interested in the least in some thread involving a spat between
C64 users and Spectrum users.

Please? Thank you.

Yea really why do these moron's keep up this mindless arguing about
which outdated platform is the best?   This was getting old 20 years
ago (seriously think about it) anyway I like my 65xe too (love might
be alittle too strong) and I even have room for a c128 in my retro
collection (heresy I know).

Yep - I absolutely agree. Sometimes training the (l)users what to expect from an old PC is more trouble than it's worth. That's why in the company I worked for (owned) until recently, we'd decided not to sell second-hand PCs at all due to the high-expectations low-cost mentality.

We had our fingers burnt with this very early on in about 1994 when we gave our old 286 PC to a friend who was starting a small business. I

cleaned up the PC, re-formatted the 20Mb hard drive, gave her our copy
of WordStar (which we wouldn't be needing any more) and actually wrote
a small db in Clipper so that she could keep track of her clients. All
I charged her for was a small amount of extra hardware needed (think it
needed a new keyboard or something) and she refused to pay. Why?
Because, despite the fact that she was initially very happy, a friend
had popped in, looked at the PC and told her that all PCs should be
running Windows 3.1. Since this PC wasn't, then she dumped it back on
our doorstep, complaining bitterly that we'd taken advantage of her
lack of knowledge!!

I learnt then that the only way to avoid problems with most
computer-illiterate people is to sell them new equipment.

/matt

The spectrum too had thousands and thousands of programs, and no doubt did other machines. The argument for the C64 having this many is mute, since it's not remotely unique.
>
>> 4. BBSs.

And many spectrum users were there. That's the point, another muted argument since again it's not unique to the C64.

The most popular computer of all time is the PC, also the most sold. Remember
that for every one person bashing Windows (which is not the only OS it can use),
there are probably 1,000's that are perfectly happy with it.

If you want to be picky, the Gameboy is the most popular computer of all time,
as although it can't be programmed out of the box, it still "computes", and they
sold Waaaay more than the C64 in their various guises.

The Apple needed a sound card for decent sound, but the common one had a
pair of AY8910s.

I was there with my brother's Apple //c. So nothing special there either.

-uso.

The windows based emulator on emulators.com doesnt need either bios.. Might
run under wine.. not tried.

This counting your recent "bed-wetting" experience?

And the many posts about recovering a game you lost many years ago,

including the dream sequences you had that you thought was an attempt
by your subconscious to provide you with a program to recover the data?

Those were just in the last month or so...

Resist a chance to make a dig at windows as a proof that good does not equal
popular or "most"?

Nope, can't resist for a second, what are you going to do about it?

On the internet there are no rules for Commodore nor any thing elase.
In fact you can break any of the rules you wish without going to jail
except the new ones on Child Porno and I back that one up 100%

I think most Commodore users like Atari 8 bits, and vice versa so no
insecurity there. Spectrum owners on the other hand...

Tell you that XP leaves that steaming turd of an OS Linux for dead?

Wrong. PC is a generic term, the hardware has substantially changed between each model. Of any particular model, with the same specs, the C64 is the highest selling computer ever. Not likely to change any time soon either. Guinness book of records also lists this.

 Remember
> that for every one person bashing Windows (which is not the only OS it can
> use),

Damn right, I gave Linux the flick after playing with XP for a while.

Now you are talking crap, it's not nearly the same thing.

Agreed, except for that last bit. The BBC micro was a bit crap.

>> 4. BBSs.

The VW is to cars what the ZX is to computers. Fortunately there was the
C64, a real computer with a real keyboard and real custom chips to make it
exciting.

The scope isn't limited since the hardware and compatibility changes
significantly between the PC models. It is an extra feather in the C64 cap
that it achieved the success that it did without changing the hardware (in
any real way) and over such a long period of time.

Nobody takes people like you seriously. You are absolutely incapable
of looking at things objectively. You use any excuse to say "M$
sucks!". You automatically treat non-Linux users as inferiors. You
make ridiculous claims, such as "Firefox doesn't have serious
exploits". Because of the support of your back-slapping Linux pals,
you act like you are able to outclass the technical experience of a
large corporation full of top consultants, computer scientists and
researchers. You are essentially an arrogant fool.

Take a step back and stop applying binary logic to everything. Windows
has a lot of problems (as does Linux, as does Mac OS...), but it isn't
a joke. Far more talented people than you use it daily.

Linux is great, and has its place. Unfortunately, people like you
insist on bad advocacy and harm it a great deal. Save it for Slashdot,
because nobody else wants to hear it.

Nonsense, a PC is still a PC, regardless of the changes in hardware.

My PC, although way in advance of the one I had 10 years ago, can still run the
stuff I had back then.

So the PC is still the biggest selling computer of all time.

Did you know that there are more people in the UK who have claimed to
talk to deceased loved ones on, say, a BBC Micro than Americans who
have claimed to talk to God on, say, a Commodore 64?

Must be the PAL television standard. :)

Paul

The C64 is a good computer, but I started with the Atari, and it wasn't cool enough that it made me want to switch.

Some things I always disliked about the C64:

The colors/graphics always looked garish in comparison to the Atari (this is of course, purely subjective.)

Slow load times, even with the Fastload cartridge (or whatever it was called.)

UGLY case. Brutally ugly.

I disliked having to type LOAD"*",8 or whatever we had to type to load a program (although I also think that Atari made a mistake by making us always hold down OPTION to boot the vast majority of games.)

Some things I really like about the C64:

Sprites! Atari should have come out with a new ANTIC/GTIA that added another couple of PMs. That would have gone a long way in battling the C64. The 130XE should have had this, but instead it only had 128K.

SID. Although I disagree that the SID outclasses the POKEY so much. I've heard some pretty cool tunes on the Atari, but still the C64 had more music talent coding for it for whatever reason. The POKEY wasn't really harnessed as much as it could have been.

More developer support. Atari made some very bad marketing decisions. It was a great architecture (for 1979, a couple of years before the C64 was released.)

I really don't know if Spectrum users are insecure, or... perhaps green with
envy because C64 users can type on real keyboards, rather than that rubber
nightmare found on the ZX.   ;-)

Please don't do that... At least not too quickly. Make him suffer a whole
lot first! Make him type the entire text of "War and Peace" on the rubber
keyboard of a ZX Spectrum.

I believe the part number would be the the printed number CXL4002,
similar to all Atari catridges.

No, the number I am talking about is an imbeded stamping on the face of
cartridge. It's not printed, just stamped. I'd show you a pic but my
little webcam won't pick it up.

There are no such stampings on any of my other Atari cartridges (not
that I have a lot of them, I was never a collector).

Yep, I agree 100%.

Linux has it place, but for entertainment and general home use Linux can't
touch XP, in fact it isn't even in the same league.

Completely different hardware, so not comparable.

> So the PC is still the biggest selling computer of all time.

Wrong, not in the example given, stupid.

Look it up in the Guinness book of records, stupid, it's is a specific
claim.

I agree with that statement. And, I see a parallel.

The ZX Spectrum has it's place, but for entertainment and general home use
the ZX Spectrum can't touch the Commodore 64, in fact it isn't even in the
same league.

I'll agree with that. I've seen some great looking/sounding Atari stuff.
Even though I'm a C= user, I don't have any problem saying that I've seen
quite a few games that are better on the Atari than the C64. As for the
Spectrum, as I've said before, it's far more comparable to a VIC-20 than a
C64. Everything I've yet seen or heard from the Spectrum looks and sounds
like crap.

Yes, the Atari was a nice computer, and if the C64 had never surfaced,
I would have definitely purchased an Atari. I also had a 2600. Good
machine.

I have no problems with it here, and thats exactly what I use it for. I have it on 3 comps in a LAN, a laptop, and a variant runs on my Atari Falcon 060.

I'm proud to say I'm MS free.

However, I'm not slamming anyone for using XP if they wish. Thats their choice.

Just compiled/installed the atari++ emulator.

Thomas, this is a very nice emulator. I seem to be missing most of the
cartridge emulation types (when I compare what is in the menus vs. the
docs). I've run it in both X11 and SDL frontends and it's a great
treatment of the Atari 8-bit. Probably just needs a recompile with
-enables.

The compile was a little spooky. The first time I did the make it
started giving me lines like:

/bin/sh: cc: command not found

After a moment of doing thatt I would abort the make and go through the
"makefile" and see if the configure missed anything. Since the makefiles
don't seem setup for a "system-wide" install of the emulator I finally
just shrugged, ran "make" and got some diet "12939" formula while it
merrily churned. By the time I came back it was showing the

"Compiling *.cpp"

lines and the compile was apparently working.

After I set it up with a dos 2.5 boot disk and an Action! cart inserted
I tested the whole key-map business.
It's really great to be able to use the ctrl-shift-M to hop out of the
editor into the monitor, then jump to DOS, and then hop back into
Action! again with my program still in memory.

Thank you for pointing the way to Atari++, it's going to let me program
in Action! again, which is so much more fun than anything except maybe
Turbo-Basic XL.

LOL! And YOU are?! The only times I tend to bring up the subject is when some comparisons need to be made, such as, say, commodore being the "most popular" compared to windows being "most sold".
My point hasn't been disproved, best does not equal "most popular".

> You use any excuse to say "M$
> sucks!".

Why do you feel the need to leap to their defence at every opportunity? You think they need it?

> You automatically treat non-Linux users as inferiors.

I do? I make a face when they say they use windows but I don't do much more than that, I've had to use and install more windows systems than you've probably used so I feel entitled to make a face.
:-p

> You
> make ridiculous claims, such as "Firefox doesn't have serious
> exploits".

Nope, but any exploits firefox does have tend to
a: get fixed quickly, and
b: not cause any long term system problems on operating systems built with security in mind.

How long was the last IE exploit in the wild and known about before they even admitted it existed? Has it been fixed yet? Does it cause serious

problems to the entire OS? Perhaps open up another vector for viruses and malware?

> Because of the support of your back-slapping Linux pals,
> you act like you are able to outclass the technical experience of a
> large corporation full of top consultants, computer scientists and
> researchers. You are essentially an arrogant fool.

Now what's he on about?
When have I ever mentioned "back slapping linux pals"?
I don't recall ever mentioning large corporations full of consultants either.
I do know one thing though....
a: managers believe microsoft
b: managers make the decisions on what to use
c: businesses suffer from an enertia, resistance to change.

But that believe is waining, several large (and small) companies are moving over to linux to varying degrees and finding it a big cost saving.

> Take a step back and stop applying binary logic to everything. Windows
> has a lot of problems (as does Linux, as does Mac OS...), but it isn't
> a joke. Far more talented people than you use it daily.

Some of the software on windows is indeed excellent...
but the underlying platform is only where it is today because of illegal shenanigans by its creator. And the security model of THAT is a joke.

> Linux is great, and has its place. Unfortunately, people like you
> insist on bad advocacy and harm it a great deal. Save it for Slashdot,
> because nobody else wants to hear it.

Yes, linux is great. And it's place is anywhere windows can go.
Much as you'd like to disagree it's certainly more ready for the desktop than ever before, and is still improving. AND more suited to the desktop than windows XP is at the moment.

Thank you Microsoft, for all that spam I receive every day, most of which is sent by botnets created by using a virus to install a trojan-server which begins sending out that crud to all and sundry without the owner's knowledge.

Thank you Microsoft for that flood of viruses I got that rendered my main e-mail account at the time totally useless because it would fill up before I could clear it. In fact, on that day, I believe the entire internet ground to a halt, almost everyone was affected and 3 days of e-mail were lost.

Don't try to deny it
Don't try to defend them
Because those things were indefensible for a software company with their resources.
Put simply, they didn't give a damn about security.
In fact, until the Win98SE/WinME active desktop open to the entire internet

cockup, it's obvious security wasn't even in their vocabulary.

I will continue to make jokes at the expense of microsoft. So what? Who
does it hurt? Microsoft? I doubt it.
Think they can't take it?
They have been the butts of jokes for 30 years, why should I stop just cos
you keep whining?

You think you're doing yourself any favours attacking me everytime I take a
dig? You're looking far more fanatical than I am. You'll be attacking my
signatures next.
Tsk.

Wasn't really trying it, I just used it to see if I could get it to work on
Windows. That was how I found out about having to give it the full path and
filename of the roms.

  Might I suggest Atari800Win Plus version 4 (see
> link).

You can suggest it, but I'll be using it about the time demons start
flinging snowballs in Hades. :) Any and everything I can do with Linux, I
do. I only use WinXP to play a couple of games that don't have linux
versions or compatibility with the Cedega windows emulator, mainly this is
just Final Fantasy XI.

  I love this emulator for use with Action!. You can map the
> CTRL-arrow combinations to just the arrow keys. CTRL-Shift-up/down

I've played with SpartaDOS and MyDOS, and of the 2, I prefer MyDOS also. I
recently started using MyDOS (like 2-3 months ago), and I havn't farted
around with it a lot. Works just dandy, but I havn't quite figured out the
way the directory switching works... I guess I should just read the manual
for it.

I noticed that option in the menu for Atari800, but havn't played with it yet. Would be interesting to use cc65 to compile C source to assembly source, then assembling it with Mac65 on a real 8-bit. So far, the only drive emulator I know of that can read files directly from a hard drive and not from an image is APE.

I have never even seen an Action! program, and I know absolutely zip about it. Maybe something else to give a spin.

> comprehend. LOL!

I started screwing around with Assembly when I was 10. Do you have ANY idea how hard it was to jump into Assembly with the atari assembler and it's manuals?! At 10 years old and with good understanding of BASIC, I stared at the assembler manual for ages, just totally confused. Then Dad came to my rescue! He bought me a copy of Compute!s "Machine Language for Beginners". It took less than an hour for me to develop a clue. After reading through just the listing on the instruction set, it instantly made sense.

My first real project was a driver for a CX85 keypad. My mom was thoughtful enough to snatch up anything that had Atari on it at every yard/garage sale she went to. Most of the time it was crap. Busted controllers, dead 2600s and what not. I got a few real gems out of the piles and piles of junk. One of which was an 810 drive, with no DOS. I got a copy of DOS 2.5 from my principal (who eventually GAVE me his entire Atari collection!) and away I went. Shortly thereafter my mom found a "weird little box that looks like a calculator without a screen, and has Atari on it".

The stuff I got from my principal was two 1050 drives, a dead modem, the ICD P: R: connection, and a nuked 1200XL. Not bad for a freebie.

> still works and I still love it. It has the best A8 keyboard (IMO).

Heh. Dad bought the 800 in '80. I entered the picture in August of '81. When the XE line came out, he got a 130XE. Laer he got a 286 and I inherited all the 8-bit stuff. And so it began. :)

Thank thank you very very very much that you do not slam me bez of
using XP.
Which grace you mete out to me.

Thank you, leaving me to my own choice.

Oh humble giver of permissions I will progress using XP.

(Are there more of such kind? Or is this just equity?)

Best Regards,

Daniel Mandic

Morons is an understatement.

My system of choice was the Apple //e and //c because that's what I had
access to. The C64 may have been a better system for games but I never
really had access to one. Well, I've used 'em a few times. I have fond
memories of all the systems I've used and would get all of them again if I
could.

Ken Swanson wrote:
> Sorry for the top-post, but where are you guys getting figures of 128
> and 256 colors?

The Atari has palette 128 or 256 colors to choose from. Showing them all
at once is a different story. The C64 has just 16 colors, that is it,
but showing them all at once is easy.

> The Atari really only has 16 colors. Or in another graphics mode you

>
> Although I have no experience with the C64, I think the Atari is better
> graphics-wise. The display list manipulation that you can do is awesome.

Display list seem like a cool feature, but I don't see what it can do
more than what the C64 can do with raster interupts, with the exception
that display lists do not require CPU load. The VIC chip can be
programmed to generate an interrupt when a certain raster line is
reached. Raster interrupts are useful for all kinds of tricks like
switching graphics modes halfway the screen, soft scrolling only a part
of the screen, changing colors, sprite multiplexing, opening the
borders...etc.

> I was aghast when I first tried an IBMPC and realized how lame
> the graphics were compared to Atari 800. 4-color CGA?... blah!

 From a C64 perspective CGA graphics suck big time too.

> I think the sprites on the C64 might be easier to use than Player
> Missiles on the Atari however. I didn't like the fact that to move
> them in one direction you actually have to copy the memory around
> (if I remember right).

Not on the C64. You just provide the X and Y coordiantes and the VIC
chip takes care of the rest. On the Atari you have to move memory around
if you want the player to move vertically.

> To move them in the other direction,
> you just had to change one value. I forget which way was which, but I
> think the horizontal direction was the easier of the two.

Correct.

From the C=64 v Speccy Flame War FAQ
http://www.speccyverse.me.uk/comp/accus/spectrum/

Q1.1 The ZX Spectrum can be used as a door stop?
 1.2 Did the ZX Spectrum normally use REM statements to store machine code?
A1. People who say this are thinking of the ZX81 or (TS1000 which is a
    ZX81 clone) these are not Spectrums. While the ZX81 may be wedge
    shaped it will definitely not fit under a door.

Software base for the ZX Spectrum
       9968 WoS archive minus type-ins, demos, compilations, covertapes
      +1592 MIA
      +1707 demos
      +3513 magazine type-ins (from TTFN, includes ZX81 etc)
      +Timex (50+)
      +books type-ins (500+)
      +other magazines (fanzines, non-UK etc) type-ins
      +cover tape programs, disczines
      +PD libraries (1000+)

```
      +CP/M (10,000+)
      +hacked software
      +other operating systems software and emulators
      +compatible programs (Pascal, Forth, BASIC, Basicode, C etc)
      +misc
      -duplicates
     ========
Total >30000 (easily)
```

There are over 4000 piece of music for downloading, and many graphic screens as well.

The floppy disk drive speed of the MB-02 is 40-50KBs according to the manufacturer 8bc.

The DTV uses a Kempston style stick which created the standard for joystick interfaces for the ZX Spectrum, why does it not use a Commodore joystick or are they the same. The best interface for playing games is a keyboard and the range of game styles must be limited by only having a joystick as the input method. JSW was easier to control on keyboard than joystick.

Like Starglider I am still waiting for Whetstone, Dhrystone 2.1 and any other benchmark results for the C=64 (especially interesting that you think it cannot be beaten by the Spectrum). Atari 800 owners have yet to submit a single result!!!!

Table still stands at:

	BogoMips in C	Dhrystone 1.1 in C Vax Mips	Whetstones MIPS in BASIC (interpreted)
PC XT	0.02	0.19-0.23	0.0015
ZX-Spectrum	0.0154	??????	0.00052
C=64	0.0033	0.0205	?????
Atari 800	????????	?????????	??????????

The fastest computer so far is the Sinclair ZX Spectrum.
The annual contest between the C=64 and Spectrum can be decided by an agreed scoring system of how good each computer was. Once this is done other computers can be scored as well.

Don't expect a response too soon.

The moment they realise that they are losing an argument, they alway go silent.

Isn't that right Clockmeister?

Still waiting for my answers too.

Still waiting for these threads to quit being posted to
comp.sys.atari.8bit!

I can only assume at this point, that C64 owners and Spectrum owners, in
these threads, are damn fools and don't know how to stop crossposting.

(I deliberately crossposted to make sure this point is getting across.
Something that I very much don't do normally)

A good test so far, but I do not think that any execept the 8086/88,
can beat the Z80 at astonishing 3.54MHz.

Even that, this test should be also summarized into, IMHO. I suggest
the speccy will also loose (VIC-II, Antic etc.) here and there, but I
am optimistic.

Best Regards,

Daniel Mandic

Yeah, they're not great. But I don't think the PCs of that time were any
worse at gaming than the Apple II was. The Ataris and Commodores easily
outdid both of them, however.

These threads are nothing more than a geriatric dick waving contest. These
machines were outdated 20 years ago, but that has nothing to do with why I
keep my Atari around. It's the machine I gew up with. It was my first
computer. That's all the reason I need to keep playing around with it. :)

Well, it was certainly an interesting chat. That was the first time I ever
used my 130XE to telnet.

Greg Goodwin clued me into an interesting way to get my Atari to connect
directly to the www without the need for a PC to act as a proxy. Albeit a
little expensive...

Was definately fun.

Hi all,

Apparently my digital camera no longer functions. So I cannot take any
pictures of the MIO or the adapter card. It was an old crappy Kodak
DC-210 that took blurry pictures anyway.

The XE adapter card has two card edges, the XL side which has two
large rubber feet, and the XE side, which connects to the cartridge
port of the XE. The top of the adapter has TWO blue cartridge
connecters, assuming one for a RTIME and one for a standard Atari 8
bit cart. The PCB is masked over in black with ICD Inc, EXTNDR REV 1
slightly visible from the mask.

Any other questions, feel free to ask.

Thanks,
Rory

Thanks guys. I've tried different SIO cables with similar results. I
don't know if you're familiar with the Indus in particular, but it
makes a lovely whirring sound and then spins up through 39.

Currently, they sometimes do that, and then they load disks, but
usually there more of a quick hiccough and they won't read the disk.
(LEDs do the standard go to 20 and then G4 BEEP)

My wife has this week become an Atari fanatic (sings praises) and is
going to by an SIO2PC. I also bought a new Indus AND a head cleaner
disk from Bravo Sierra for 8 bucks. Apparently I have to go to Radio
Shack for fluid--any idea on that?

Thanks again. So nice to see the Atari community is still alive.

     Just use regular drugstore alcohol. If the drive is very dirty you will have
  to use the disk 5-6 times, they dont really clean very well. Just put a few
drops of
  the stuff on the exposed portion of the disk, insert it and turn the drive on.
Then
  turn on the Atari to make it spin for awhile while trying to boot.

Where's the code at? I assume, since we aren't talking asm here, that
we all need to run standardized code, at least within the limits of our
compilers/interpreters?

Seen code for BogoMips on the Sinclair group, downloaded it, have it
stuck somewhere on here, but if you can point to all just so I can make
sure that I'm wasting my time necessarily (instead of wasting my time
unnecessarily). Not that it makes any difference...

Sorry, that's... what's the word... oh yes, *bollocks*. The C64's I/O could
be sluggish if software accelleration wasn't used (and it usually was) but
for transfer speeds the Atari's SIO bus could lightly toast *both* machines
and eat them as a snack.

Unless you mean the actual CPU power, in which case a 1.7MHz 6502 is only
marginally slower than a 3.5MHz Z80a when the cycle times of the commands
are taken into consideration and the Atari has the ANTIC hardware helping
out, assorted character-based screen modes like the C64 (in fact, they're a
bit faster because the screen RAM is only 960 bytes long for most modes and
480 for the really quick ones) and hardware sprites.

Someone's feeding the output of a Markov chainer into the thread, aren't
they...?

Peter van Merkerk wrote:
> Display list seem like a cool feature, but I don't see what it can do
> more than what the C64 can do with raster interupts, with the exception
> that display lists do not require CPU load.

They do take *some* CPU load, but the main advantage is that they do
everything *easily*; changing screen modes on the C64 is a matter of loading
the registers, waiting for the end of a scanline and dropping those values
in before the next badline has a chance to notice whilst the display list
simply says "do 20 character lines of this display mode with smooth scroll
enabled, do 8 rasterlines of nothing, do 24 lines of bitmap screen mode with
hardware scroll turned off" or whatever and the hardware splits all the
changes perfectly for you.

> Raster interrupts are useful for all kinds of tricks like
> switching graphics modes halfway the screen, soft scrolling only a part
> of the screen, changing colors, sprite multiplexing, opening the
> borders...etc.

The DLI system could do the colour changes, recycling of sprites and so
forth, the Display List itself does switching graphics modes, shunting in
and out of smooth scroll down the display or expanding the display area

vertically and the ANTIC can knock it's side borders out without any tricks,
it's a stock feature.

I have also used regular isopropyl alcohol on an old Percom Data drive that I
use from time to time. It will not read any disk until I clean it.

Yes yes. I remember that 'my ATARI has 1.79MHz and not 1MHz' thematic
very well. I dare to say that the C64 is making more nice Graphics than
the ATARI. Although both are clunky at block graphic... one makes slim
and the other the typical broad one. etc...

> Unless you mean the actual CPU power, in which case a 1.7MHz 6502 is

Well, let's get back to raw digital performance.

That's the same if you would like to compare a "AMD Athlon2000 with
onboard shared-memory GfX, and let's say a KT800pro Chipset" to a
"iP-III/550 with a PNY QuadraFX4000 AGP3.0 Universal" and say the P3
have a faster I/O. Of course, the slower P3 makes better
hardware-accelerated graphics (OpenGL and Co.), more colors and
smoother but could never get the Athlon and the rest of the system in
raw performance, except graphics (but also not in all instances, 2D
etc..).

I'm sure I'm missing something....

"neopeius" <fagin@MUNGEearthlink.net> wrote in message:
> (LEDs do the standard go to 20 and then G4 BEEP)
'G4 BEEP'? Is that an error code? Seems like I remember the Indus
at power up goes to track 39 then back to 00.
> My wife has this week become an Atari fanatic (sings praises) and is
> going to by an SIO2PC.
 I also bought a new Indus AND a head cleaner
                        ^^^^^^^
 disk from Bravo Sierra for 8 bucks.
                                              ^^^^^
'New Indus AND head cleaner' for 8 bucks? Shipping would cost
more than that.

Heh - he had me confused too, since I am the one sending him an Indus
drive. The 8 bucks was just for the head cleaner. :)

The URI for the source is
http://www.speccyverse.me.uk/comp/accus/spectrum/64vZX.zip
The ZX BASIC version of Whetstone used in the official figures is not
available, though I could produce a new version.

Hello,

I stuck a 1 Meg simm into my Atari 800. Its not compatible with
anything. Its just to see if I can do it. I combined the /SEL lines to
select the SIMM (as opposed to 3 /SEL for 3 16k cards). The Atari sees
48k (?FRE(0) returns 37xxx something) . SO MY QUESTION... how can I
generate /CAS other than using the 74ls158??? How can i condition the
signal comming from the capacitor and coil (MUX signal) I would hate to
have to use another 74ls158 just for this signal...HELP you digital
GURU's!!!

Thanks
Ralph

PS. if im being to vauge or unclear Please e mail me

Just wondering, what is the point of the 1meg simm? do you plan to
use it as a ramdisk?

My 800XL has a problem with the "=" key. The contact is very
sensitive. So sensitive that any typing on the adjacent keys can cause
the "=" to be activated. Sometimes the contact even remains closed and
I get repeating "=".

The key itself is not sticking and appears to have full travel. It's
just that contact is made at the slightest touch or vibration.

Is there any possible fix for this?

- Steve Sheppard

This part of the BogoMips code is rather interesting:

```
/*
  * This is a chronic cheat! The code is completely different and runs
  * many times quicker..<ahem>
  *
  * We could just forget it really!
  */

#ifdef Z80_DELAY
static void delay(long loops)
{
#asm
.del_loop
     call l_declong
     ld   a,h
     or   l
     or   e
     or   d
     jp   nz,del_loop
#endasm
}
#endif
```

With the current BogoMips code 6502 based systems have to do with a C implementation of the delay() function. So it is really a 6502 C-compiler test against hand crafted Z80 assembly code, in other words a rather meaningless comparision. I wonder what the scores would be if a 6502 assembly implementation of the delay() function is used.

I dunno, in looking over the code, if it is compiled as written (there
is no #define Z80_DELAY), it will use the "portable version" as that is
devined at top of source...

Take a look at it, it looks like even Linux is tuned to use an asm
version with the proper define "CLASSIC_BOGOMIPS" (if that is what that
crud evaluates to, guessing based on the 'asm' and the 'ax'). So
apparently, we all need to add an asm version to replace the portable
version for each microprocessor we run it on!

Here is the code (it ain't as long as most messages on alt.lang.asm ;):

```
/*
 *                Standalone BogoMips program
 *
 * Based on code Linux kernel code in init/main.c and
 * include/linux/delay.h
 *
 * For more information on interpreting the results, see the BogoMIPS
 * Mini-HOWTO document.
 *
 * version: 1.3

No, it has 128 (16 colors, 8 luminances each) and 256 in GTIA mode 9 (16 colors
```

and 16 luminances each). Displayable at one time.

> Or in another graphics mode you can get 16 shades of grey.

To be strict: 16 shades of any of the 16 colors.

No, it really does. Alternating these modes you get sorta 8-bit per pixel and
full 256 colors in 80x96 (or 96x119 if preferred). However, this trick only
works on PAL TV.

Nevermind I figured out a way to fix it.

Under the keycap there is a plunger. Under this are two concentric
springs. The inner spring is what pushes on the membrane switch. I
guessed that this spring was applying too much pressure even when the
plunger was fully extended (upward).

To fix it I just wound the spring tighter making it fractionally
shorter. I think it still applies pressure to the switch when the key
is up but not so much as to actually close the switch.The key seems to
have the same pressure and sensitivity as all the others.

I hope this is an adequate fix.

Regards,

Steve Sheppard

Agreed; BogoMips is based on the assumption that each iteration of the
delay loop takes two instructions. This isn't true for the Z80 assembly
version, and is most certainly not true for the C compiled 6502 version.

With CC65 (a C compiler for 6502 based systems), the C64 gets a score of
0.0036 BogoMips. In other words according to this test a C64 executes
only 3600 instructions per second. The 6502 may be slow, but not that
slow. The code CC65 generates for the delay() function is quite
horrible. The 6502 not ideal for compiled languages, and strugles with
long data types.

My 6502 coding skills are a bit rusty (at has been at least 15 years
now). But when I replace the C version with a 6502 assembly version (the
code below can be compiled with CC65), the C64 version achieves a score
of 0.36 BogoMips (100 times better than the C version). I expect the Z80
version can be improved too; a Z80@3.5MHz should be quite a bit faster
than a 6502@1MHz. However BogoMips remains a rather pointless test.

```
static void delay(long loops)
{
   asm("ldy #3");
   asm("lda (sp),y");
   asm("sta ptr1+1");
   asm("dey");
   asm("lda (sp),y");
   asm("sta ptr1");

Peter van Merkerk wrote:
<snip>
> However BogoMips remains a rather pointless test.

After a little testing this morning, I'm inclined to waste no more time
on it.

Compiled for my 450 mhz PII on Fedora Core 2, it gave 118. The one with
this release gave 884...

so the name isn't all that misleading, but it would be a waste of time
(to try porting to a machine with a weak small-C compiler, on my part,
or to use a C compiler that produces non-optimal code, thus becoming a
test of compilers like Magervalp stated some messages back).

It is bad enough that I don't do any PRODUCTIVE programming anymore,
but finally I am growing tired of non-productive stuff like this!

I think if you reread Ralphy's post, you'll find that he very clearly wrote
the following:

"I stuck a 1 Meg simm into my Atari 800. Its not compatible with
 anything. Its just to see if I can do it."

Amazingly, Ralphy wrote that in very clear English. If you'll indulge me, Kevin, I'll attempt to translate the above for you.

Ralphy says, "I stuck a 1 Meg simm into my Atari 800."

From this sentence, we can safely conclude that there is a one megabyte simm in Ralphy's Atari 800 computer. We know that there is, or was, a one megabyte simm in Ralphy's Atari 800 computer, because he very clearly stated that he had put one in there. We do not know whether this one megabyte simm is still in Ralphy's Atari 800 computer.

Next, Ralphy says, "Its not compatible with anything."

From this sentence, we can conclude that the simm doesn't actually work with any application or operating system that is currently available for the Atari 800 computer. We are basing this assumption on the fact that Ralphy has clearly stated likewise.

Ralphy then says, "Its just to see if I can do it."

Ah, the moment of truth. Why did the man climb the mountain? Because it was there! Why did the chicken cross the road? To get to the other side!

What's the point of putting a one megabyte simm in an Atari 800 computer? Just to see if it can be done.

We lay persons call it a challenge... or an experiment... or, dare I say it, an adventure... And adventure into the unknown!   As Captain James T. Kirk began every episode of the original Star Trek series, "...to boldly go where no man has gone before..."

I hope that explains it for ya, keven. Please excuse my rather extensive use of the elipsis...

Don't forget Space Pussies! Who could forget that wonderful game where you played the role of sperm-spittin' dick, blasting away at all the little pussies as they descended from the heavens and fell to Earth. Take that you pussy!

By the way, Space Pussies was a real game that was available for the Atari 8-bit computer. It was modelled after space invaders, I believe.

very funny... I realise the mod wouldnt be compatible with other 800
above 48k upgrades or any XL/XL upgrades, but that doesnt mean the
extra memory couldnt be used in some fashion as a ramdisk at some
point.

Technical specifications aside, the Commodore 64 was one of the ugliest 8-bit computers ever produced. Personally, I was partial to the aesthetic style of the Atari XL series computers. The Commodore Vic-20 and 64 computers were really ugly in that retro DEC meets the eighties kind of way. The later 64C and 128 models were a huge improvement as far as physical form factor went. The 1541 disk drive looked to seventies disco era. The Atari 400 and 800 computers wer not much better, but the XL line did have a rather appealing nouveau industrial look. The later XE line blended sleek design with that wonderful "cheap tramiel crap" look of the mid-eighties.

The TI 99/4a was something that only a true geek could love. And the Timex Sinclair? Well, let's just flip that page in the personal computer jistory books. Oh, let's not forget the Tandy offerings? Those insanely priced paperweights had all the appeal of a techno-nympho... You knew you were getting screwed if you were contemplating one of those dinosaurs.

Anyway... To each their own...

Glad you came in and waved your dick. Gee, does this qualify as a party
now? A dick waving party... Gotta love it!   Hey, where's the beer and
popcorn?

Has no one here ever heard of IRC? I know that IRC sucks compared to some
other things like MSN, AIM, etc., but you're using an Atari 8-Bit for pete
sakes!   IRC = Chat!

IRC = Big Time Chat!

that is true, and yet there are some great games for Apple II series.
Every system when faced innotive program design or programmers capable
of pushing the system to it's limits (and many times exploiting it's
flaws making them assets) has great software. That is why there is no
clear winner when comparing two so similar platforms (c64 vs XL/XE)
there are examples of (supposidly) impossible things on both
platforms.

Or last time.
This time it was someone called dunric, last time (the doorstop thread) was
started by blaine.

The virtual drive feature of AtariSIO works slightly different than
eg. the H: feature of the Atari800 emulator:

atariserver creates a disk image (which is stored in memory) on the fly
from the data in the given directory. Then atariserver installs an
image observers and looks for changes to the directory sectors. Whenever
a new file (or directory) is created or a file is changed, it applies
the changes also to the harddisk.

This approach has the advantage that it is fully compatible with all
programs and you can do everything that you can do with a standard
(hard-)disk. Eg. use NOTE and POINT to seek within files - some time
ago I tried this with APE but it didn't work correctly. The
disadvantage of this approach is that you also have all limitations
of standard (hard-)disks. For example, the size of the virtual drive
is limited to the size you specified at creation time.

So, if you really have to transfer huge amounts of data or want
access to the full harddisk, the H: handler (or APE PC mirror
feature) is better. If you do "standard work" like storing your
source code or word processing data, the virtual drive feature
of AtariSIO is better, IMHO.

If you really want to transfer a lot of huge files from your Atari
to the PC with atariserver, you can use the following approach:
Copy the first file from your Atari to the virtual image, then delete
the file (also from your Atari) or just format the virtual drive.
Now copy the next file to the virtual image (be sure to use another
name, otherwise the old file will be overwriten).

The virtual drive feature doesn't honor deletions of files and
formatting a drive, so all the files on your PC will be preserved.
The deleted files just won't show up in the virtual drive when
you list the directory from your Atari.

so long,

Hias

> Also, what is the likelihood of an internet modem and maybe printing support
> in this version? ;)

Printer support is already working fine (you can print to a file or
through a pipe, eg "|lpr"), and set up Atari EOL (character 155)
conversion: LF, CR+LF, or plain (no conversion).

To add modem support I need some more documentation about the
Atari 850 protocol. The docs that I found so far weren't detailled
enough, they just described some of the basic principles.

So: if anyone has some real good documentation about the Atari 850,
or the source code of the 850 ROM and the 850 driver, please email
them to me.

BTW: the new version of AtariSIO also supports XF551 transfer modes
(at 38400bps), an integrated gamedos (MyPicoDos 4.04) for virtual
drives, and a nice "remote control" feature. You can even execute
shell commands on your PC and have the output sent to your Atari.

so long,

Hias

> 1. Best selling computer of all time.
> 5. The most popular computer of all time.

Please could you prove this to me and how much better selling it is
than competing systems, and do not just quote Guiness World of Record
which is quite often wrong on computer records.

> 2. VIC-II/SID chips.

These extra chips tried to offset the slow speed of the CPU in the
C=64 and in the process increased the price.

	BogoMips in C	Dhrystone 1.1 in C Vax Mips	Whetstones MIPS in BASIC (interpreted)
PC XT	0.02	0.19-0.23	0.0015
ZX-Spectrum	0.0154	??????	0.00052
C=64	0.0033	0.0205	?????

The ZX Spectrum Bogomips figure was achieved using z88dk version
1.6 cross-compiling to produce a TAP file. Then the TAP file was run
in the Fuse emulator in 48K Spectrum mode. The C=64 Bogomips figure
comes from the HOWTO and was run under Vice. The Dhrystones where done
with -DROPT and compiled with C Power 2.8 (source Rick Richardson).
The Whetstones are Quick BASIC for PC/XT and ZX Spectrum BASIC (source
Roy Longbottom), compiling or using a different language would help.

> 3. Thousands upon thousands of programs.

The total number of programs that run on the ZX Spectrum is in
5 figures with new releases still happening, see WoS for evidence.
The question is how many programs has the Commodore 64 got?

> 4. BBSs.

The ZX Spectrum can access and run BBSs, however BBSs were not that
important to most people.

Most people did not buy the Atari 400 because it had 8KB RAM and a
membrane keyboard while cost more than a ZX81.

ROTFL!

You don't even know who Brotha G is, do you?

He doesn't come from the Atari community, and he doesn't come from the
Commodore community. He's done a hell of a lot more for the Speccy community
than you have, I can tell you that :-p

See if you can figure out who he is!

D.

Mostly common.

Should I everytime control who wrote that posting, I reply to!?
I see it.... In your case it's Paul Dunn, I guess.

> See if you can figure out who he is!

I don't do such things. If so I would simply ask or stumble somewhere
else upon an information about that person by chance. If not, then it
was not important or a question of my mind, I guess. :-) Never mind!

Unfortunately, I've not had a chance to try out anything else with it. I
bought the cable off ebay. I'm pretty sure I've got one of those RF
adapters lying around somewhere-I'll try it next, just to make sure that I
do have video coming out of the 800XL.

Thanks for replying! :-)

I'd suggest that before you start flaming people, you should at least read
your own group. You flamed a rather highly respected member of CSS. The man
who brought us the most detailed disassembly of the Spectrum ROM doesn't
deserve to be insulted by members of his own group.

Well, a little research on your part would have saved you from looking a
complete pillock.

D.

This confuses me, and leads me to believe that you may have
not had the VCR set to display the line-in connection.

The yellow connector is video, and will not show up on any tuned "TV channels".
You have to choose video-in somehow on your VCR.

Also, what did the ebay ad say about the condition of the thing?

Ken

You mean you will be able to manage disk images from the Atari? SWEET! The
box I'm setting up right now will be PERFECT for that! It will serve no
purpose other than to run Atariserver and SSHD. That's awesome, man.

 You can even execute
> shell commands on your PC and have the output sent to your Atari.

I don't quite follow here. What uses would that serve?

Its a definite possibility.

I'm not sure if you're talking about the cable or the 800XL but in either
case, they were supposed to be in good working condition. I'm sure its
just me... :-)

Thanks.

I'm talking about the whole thing as a package.
If the seller said it worked, it probably does. ...or did the last time
he used it, which may have been 20 years ago. :')

Do you have a stereo reciever you could plug the audio cable into?
If you just plug the audio cable into a line-in jack on something, and turn on the
Atari, you should hear a faint buzzing noise for 2-3 seconds.
It maks a "BbBbBbBbBbBbBbBbtt" sounds while it's waiting to see if you have a
floppy drive connected.

If no line-in jack... then you could *probably* just touch the white plug to a
headphone plug carefully,
and listen for the "BbBbBbbbBt" sound. Put the headphones on, touch the outer
ring on the white plug to
the largest metal part of the headphone plug, and the tip of the white plug to the
closer of the two smaller
rings on the headphone plug. It will not be loud and it won't burn out your
headphones.

This would at least tell you your Atari is booting up. It probably also has video
and you just don't have the VCR set right.

Ken

Well, I guess that rules out any serial number theory.

Thanks.

It is not I who have a fixation with the rubber keyboard of the ZX Spectrum.
It is the Spectrum users who actually think that they can type on them!
:-P

Yes, exactly! The "remote control" feature works kind of like a
text-shell to atariserver, basically you just send commands in plain
text and get back some output in plain text, too. For example
"st" means "print status" and you get the current drive assignments
and other settings.

> You can even execute
>> shell commands on your PC and have the output sent to your Atari.
>
> I don't quite follow here. What uses would that serve?

There are tons of uses for that. For example you can create a
new directory on your Linux box, rename files, check and manage
the printer queue etc. You can do (almost) everything with it,
just like when telnetting/sshing to your Linux box.

The only limitation is that you can't run interactive programs,
like a text editor or so. But all non-interactive programs work
fine. For example: "sh find . -iname test*.atr", "sh mount /cdrom" ...

so long,

Hias

Interesting. The Spectrum _never_ had a _major_ share of the 8-bit market,
while, as the subject line of this thread reads, the Commodore 64 ruled the
8-bit world!

Do remember that the article only covers from a US perspective. If a UK/Europe
perspective was conducted, the chart would be VERY different in the 8-bit era.

No, the Acorn BBC was far superior for general home use, and I'd say the
Atari 800 was technically a better game machine....(OK sound wise pokey
sucked slightly compared to SID..)

What could the C64 offer? Slow processor and crap disk system - a mildly
upgraded spectrum was more usable.....

Crap sound and graphics, crap keyboard and crap expansion options... the
Spectrum is the cheap and cheerful alternative if cost is your main priority
and not the actual computing experience.

The C64 kicked ZX arse in Europe too, except in the UK which is a market
that buys British first no matter how crap it is.

They didn't offset, they offloaded. The figures above do not in any way show
which system was better in actual use, which ofcourse anyone with eyes and
ears knows was the C64.

Poor excuses, BBS's were very popular at one time when there was no internet
and the C64 was a popular system to run them. The C64 was also popular in
robotics and amateur radio. None of those niches was fed by the lowly,
boring and unimaginative ZX.

> Most people did not buy the Atari 400 because it had 8KB RAM and a

I genuinely don't understand how a machine which sacrificed RAM, CPU power
and a decent ROM for more a video chip designed for games and an oddity of a
sound chip could be described as more of a real computer than its
competition.

I had a C64 and a Spectrum growing up. I preferred the Spectrum because it
had better publications, better textbooks, better tools - and the games were
more fun. There's NOTHING on the C64 that I remember fondly. In fact, when I
was a kid and didn't know better, I thought the C64 must have been an entire
generation behind the Spectrum because the sound seemed broken, and all game
graphics seemed slapdash and badly designed. The machine ended up under a
pile of books, while the other machines in the house were played until they
gave up the ghost.

Honestly, I'm just about sick to death of the C64 vs ZX thread.

Clockmeister, if you need instruction on how to remove a newsgroup, such
as comp.sys.atari.8bit, which obviously does not belong in your current
"discussion", I'll be glad to help you on how to do this...

I'm only cross-posting now, to make sure you get this message.

Thanks.

I don't need instruction, thanks anyway.

Hope you get mine too, it is the last comment I will make on the C64 vs ZX
topic.

The C64 wins every year, I really shouldn't bother with it.

Enjoy your computers and your Christmas!

First, a little background. I have been a heavy user of C64 back in mid 80s, and dabled with the Atari 8-bits and Apple IIs. I've never went past BASIC and some simple ASM routines as far as programming. It's been a long time since I've used an 8-bit machine, until a couple of months ago at a friend's house, when he fired up an 800XL, and we had a blast playing some old games... Ever since then, I started having an itch for actually doing some assembly coding on an 8-bit. I bought a C64, Atari 800XL and 130XE, and now am having a hard time deciding which way to go :)

Basically, I want to learn the ins and outs of the machine, do some "serious" assembly coding, just have a blast, and do not have the time to invest in both architectures, but also do not want to start on one machine just to find out that the other one is in the end faster/richer graphically/easier to control the screen with.

On to the question!! From a purely technical perspective, is there a discussion/article/etc. on the net somewhere that discusses the Atari vs. Commodore hardware in great detail? Anything from pros/cons of PMs of Atari to C64s sprites, limitations of VIC II vs. DLIs, etc...? All that I have found so far has been quite a childish trolling, and I'm really interested in solid technical discussion...

In particular, I'm interested in doing graphically oriented demos and games. Atari is great with it's 128 colors, but I've read that you can duplicate it on the C64 with special effects. So, I would be interested to know how well/accurately/densly can you control changes to the screen data mid-line, during V blank, etc. Is the DLI programming style, which seems very different from a straightforward C64 way (well, except in the way you have to address the individual pictures), better

in the end? And how about interupt programming in general? Which
machine has more usable posibilites?

Sorry for the long post, but I really hope that I can get some
reasonable, constructive feedback!

Thanks!!

MrScout

Who cares... Not me. I had one for a short time and ended up giving it away. I found out my Atari 800, XL, XE where actually better computers. Take a C64 and an Atari 8-bit apart and you can really see the differnce. Being more popular does not always mean better.

spike1@freenet.co.uk wrote:

> > Must be the PAL television standard. :)
>
> The PAL tv standard is a cause of dementia?

Hi Spike!

I think he just want to say his Commodore looks even better with the
PAL.
Dunric is a amenity exception in this Flame-War..... other are using
non-usenet insulting words, I don't like.

It makes fun, indeed. But some comments must not be dear C64-Lamers.

Nothing for bad Spike.

Kind Regards,

Daniel Mandic

P.S.: Sinclair and Commodore are popular, but nothing as ATARI ;-)....
they still develope/manage/andmore good-quality Software, IMO. They are
really worth the brand, and many programmer can benefit I hope.
Commodore is a brand without visions, I never heard honourable mentions
about the developer etc... most are self-seeking boaster. And the
visions are getting slighter from day to day, now that Atari overrunned
the C64 totally (Atari also have very good support - ABBUC), they try
to save somthing while attacking Sinclair which have IMHO the best
Computer support I ever saw. I started with Sinclair User and I must
say, that's it!!!! Not that lyings (maybe also of non-knowing or
aggressive business purposes) and dreamings I read in relevant german
magazines.

Don't worry Sinclair is one of the most honourable Brands and have made
many people happy, not the mention the eurpoean-wide acceptance,
probably due to the price ezc etc etc etc.... Thanks Sinclair.
And his behaviour against Hardware-Pirates reminds to an other
honourable Person on this world.

So don't use it Simple as that. The fact is though, linux DOES have the
apps, just not the ones you like. (There's not one thing (in general, no
specific software packages please) that linux can't do that windows can

And for the most part, linux does it free and gets almost everything you could
possibly want installed as part of the installation process...

Rather than windows where you not only need to install the drivers that came

with the motherboard, you then have to go through the clickyhell of
installing works or office, plus all the other software (unless you like
playing solitaire and using notepad)

Have you tried the "KEY OFF" spartados command to kill the keyboard buffer?
I haven't but was wondering if it would solve the ACTION issue.

IIRC (and I may not remember since the BigD is in storage right now), I
think the BigD read 1-40 (outside to inside) and then returned to beginning
of disk for 41-80 (outside to inside). I am pretty sure that's how it
worked.

Don't know about the others although I do have the DSDD Percom here
somewhere (also in storage).

Thank you! Thank you! Thank you!

That solves the problem!

Is there a way to set KEY OFF as a default? I'm a light to
non-SpartaDOS user but this would sure come in handy.

I formerly had a crude work around but I definitely didn't like it. In
Atari800Win Plus, I could set the the Keyboard Option, Use Windows
Typematic Rate. This solves the out-of-control key repeat problem but
it precludes the use of the CTRL+Shift+Action Command keystroke
sequence, without it one is stuck in the Action! editor. I was forced
to switch back and forth between typematic modes, quite a nuisance.

Thanks again.

I don't care either way. At the end of the day I think Linux probably is the
better OS, although I doubt that it's more suitable for desktop users.

You've missed the point entirely. I simply find your rampant, blind opinions
and constant mentioning of Linux very irritating. Sometimes ignorance gets
to me that way.

I don't know why I'm arguing with a person who feels the need to put his
degree in his signature!

So because it didn't work for you personally, that condemns it? Don't
think so.

Honestly, Linux won't play every game out there, and it might not play the
latest, greatest version of game "X".

Its close enough for me and my kids though. We play a lot of the following
under Linux:

World of Warcraft (or did-we let the trial sub run out)
Diablo 2: Lord of Destruction
Starcraft
Star Wars - Jedi Academy
Knights Of The Old Republic
Ditto - Sith Lords
NeverWinter Nights
Quake 4
Dungeon Siege
Doom 3
Morrowind - Elder Scrolls
Unreal Tournament 2004
Warcraft 3 (Frozen Throne)

Not counting literally hundreds of non-commercial apps and games that are
commercial quality or near commercial quality (and free).

Who needs Windoze...not me! :-)

Create a "startup.bat" file in the root directory of the atari disk(s) that
you boot from with this line in it:

KEY OFF

Glad I could help!

> the C64 has an 8x1 attribute mode but I forgot the resolution.

The C64 can do 8x1 attributes with 320x200 resolution. However, like the Spectrum, this mode requires a lot of attention from the CPU and very precise timing. Normally the the VIC chip reads the attribute bytes only once every eight lines (the so-called "bad lines", because when the VIC chip reads the attribute bytes it slows down the CPU). Basically before every display line the VIC chip has to instructed to reread the attribute bytes. As far as I know there are no C64 games that use this mode; it requires too much CPU time and some clever undocumented tricks to make it work.

> Is there a similar mode on the Atari?

I don't know much about the Atari, but I believe it doesn't have

attribute based graphics like the Spectrum and the C64. IIRC the Atari
can display only a limited number of colors per scan-line.

R:B Lite is *finally* available to buy from www.download-trader.com or
from eBay (item number 8737921450) for just =A31 sterlin! It comes as a
screen-res PDF sent via email. The first issue features:

> A four-page feature on Cinemaware, speaking to founder Bob Jacob,
> Four reviews (two new home-brew games and two Saturn shooters)
> Retro News
> Quotes from Margaret Thatcher
> Three previews
> A picture of a Gizmondo (for those of you who haven't seen one)
and more!

Preview pages are available on our forum over at www.retro-bytes.com

What are you waiting for then? Fill yourself with festive cheer and get
hold of your copy.

Regards,

Shaun.

Ps, Those who have pre-ordered and paid will already have their copy in
their inbox. People who have pre-ordered and are waiting for further
instructions will receive an email soon.

No Atari coverage for this issue by the way :-(however, this is bound
to change in future issues!

My current development version of AtariSIO for Linux also has such a
feature :-) You can access files (more or less) direct on your hard
disk - both reading and writing is supported. This feature works with
all DOS 2.x compatible DOSes (including MyDOS with subdirectory
support) and it emulates disks up to 65535 sectors in SD and DD.

I haven't released this version officially yet, but if you are
interested I can send you the current snapshot.

so long,

Hias

If you want to include "tricks", like using the player missile "sprites"
you can get at least 9 per scanline or using precise-timed DLIs, you can
increase that number by some small amount (since you can change both the
playfield and player/missile color registers on the fly.)

Hi,

You sent this to me, and it seems pretty cool. I have a question though,
about the ability to write files to the PC. If you write a very large file
(say 32,000 or 40,000 sectors), can you write another such large file, or
will you get an error message telling you the disk is full?

Thanks,
Shawn

Well, its been a long time, and I finally got a chance to try to fire up
the 800XL that I recently purchased on Ebay.

I've got some kind of RCA cable with the DIN plug on the end that plugs
into the 800XL, and goes to yellow and white RCA jacks. I've not acquired
a monitor yet, so I tried it with 2 different VCRs here, both of which
have audio and video input jacks.

The red power light does come on, but I can't get any audio or video
onscreen. No self check test. I also tried it with a cartridge, both
holding option down, and not. This is with the TV, VCR, and 800XL all set
to channel 3. I also tried it with VCR mode on/off, and the TV mode
switched back and forth.

Do have I have the wrong cable for this perhaps?

Any helpful suggestions on how to procede welcome! :-)

Good for you, but I don't want to search endlessly for something I can
simply pick up at virtually any store.

Linux is great for wasting time IMO and I don't consider my time to be free
when I'm wasting it searching out something that may/may not do the job.

I'm sure, if you are determined enough to waste your time searching them
out. I can't be bothered with that anymore.

> And for the most part, linux does it free and gets almost everything you

Fishing through mountains of crap as you go. No thanks, been there and done
that.

Half an hour out of your life to install everything you need is much better
then spending an eternity looking for something that might do the job.

Nope, I'm over it but you are welcome to it.

From FAQ:
(looking at back of computer, not at the pins on the cable.)
3   1
 5   4
    2
1. Lum
2. Gnd
3. Audio
4. Composite video (use this one.)
5. Chroma

Why use a vcr? Plug straight into the video and audio of the TV.

$3500, holy shit and we thought the AmigaOne was expensive.

Wouldn't emulation be faster then an '060 Atari by now?

I have two Indus disk drives which for over 20 years provided
trouble-free service. A few months ago, both stopped working. They
don't make the smooth sound on start-up anymore. I wonder if I put in
a disk which killed them (seeing how I put the same disk in both
drives, maybe it got them dirty or something).

Is there any way to fix these? Is there some kind of disk cleaning
disk (like they made for VCRs?). My system is utterly dead without
them and I am very upset. Please help if you can.

Gideon

The modulator outputs video and audio on channel 3 or 4.
If you are trying to get video from this cable on channel 3 or 4 it wont

work.
Try plugging the cable into audio and video inputs on your VCR and
select that input from the VCR channel selection.

I should add that they work sporadically--sometimes they make the right
humming noises and will play some disks. But it's not consistent.

I might have had a clue at age 20, but 26 years later assembler no
longer makes sense to me.

The only useful assembly code I ever wrote, coincidentally sped up the
key repeat function on the 800. Most of my code was lost on tape (no
disk drive for me in the early days).

When I bought my 286 I pretty much retired my 800 as well. I mean I
probably turned it on every couple of years or so but that's about it.I
didn't become enthused again until last year, about this time.

Are there any Atari 8-bit/ST users in San Diego county? It's been so
long since I've gotten to talk to one face to face.

Actually, the Freddy Users Cartridge Key was very useful. It was
released in 1981 and incorporated into the 1200XL as stock. Because of
that machine's unpopularity, however, very few users ever got to enjoy
the memory enhancing properties of the firmware and instead were stuck
with the default Freddy.

I'm pleased someone remembers it, however.

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!
